The manufacturers of hardwood doors of the veneered type have for years been boosting these in competition with the cheaper solid pine doors, not only because of their better appearance and their superior quality, but they have sought to impress time and time again by illustration that the extra cost of the hardwood door is so small that it will not amount to an item of more than \$20 or \$25 in the equipment of an ordinary home. Had they figured on the same basis of the figures shown above their calculations would easily show the hardwood doors costing twice as much as those made of pine.

There is a whole lot in the view point. If a man sets out to show that it costs a millman more to work oak than it does to work pine, he can easily find incidents and figures to back up his argument and to show that he is right. On the other hand, if he is interested in boosting oak he can easily find a way to make these figures show radically different results. This would make a wide difference in opinion and each case perhaps result in error. The right way to figure these things is to take the middle or unbiased ground, study each analytically and without a desire to prove any special point, but with the one purpose of finding out exactly what is what.

Admittedly it costs more to work oak or any other hardwood than it does to work pine. It is a harder wood and requires a little more care in handling and it calls for a higher order of finish than is expected on yellow pine. When it is finished, and when it is finished

properly, one has a product to be proud of. Oak is a wood that may be made to take the same high finish in millwork as is shown in the best grades of formiture, which is a finish that no one pretends to get from pine. There is no comparison on this point. If there were people would be making furniture of pine and offering it in competition with oak. Even if the cost figures show double those given in

this case, the quality of the finished work justifies the extra cost, This is no reason, however, for putting a handicap on the progress of oak with an unnecessary burden of cost in the figures. That is why those interested in the manufacture and sale of oak should study these figures and get other figures for comparison to the end that they may remove the handicap of extra cost charge against the working of oak.

The Wood that Goes into Aeroplanes

Probably the most exacting use of wood at the present day is required in the manufacture of aeroplanes. The making of these machines is a new industry, and as yet not a large one; but it is of great importance and its importance will increase. It seems that there is no substitute for wood for certain purposes-shuttles is one and aeroplanes is another. These air machines are being made in various parts of the world. Some of the earliest were manufactured in Missouri, and now a factory is getting under way at Grinnell, Iowa-the Grinnel Aeroplane Company. A

machine is now being built there for W. C. Robinson, which is expected to establish some world records. The present motor is 110 horse-power, but if that comes up to expectations another of 220 horse-power will be made. The machine will be ready for the great contests to take place next year at the San Francisco fair.

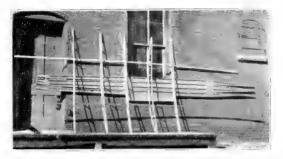

The Thomas E. Powe Lumber Company of St. Louis is furnishing the ash for the manufacturing company at Grinnell. For some reason, the Missouri ash appears to possess special properties fitting it for aeroplanes, and manufacturers have been drawing supplies from that region for some time. Such ash must have every good quality and no bad ones.

Two years ago the Forest Service published a report of the woodusing industries of Missouri, containing what was said to be the first government statistics on woods manufactured into aeroplanes. The report was short and is quoted below:

"The making of aeroplanes is a new industry in this country, and Missouri is the first state to supply statistics of their manufacture. A few dozen were turned out in 1910, and only three woods were reported as to amounts, though others were made use of, at least for experimental purposes. Locust and red gum are mentioned, but the exact uses are not stated. Sitka spruce supplied eighty-four per cent of all; mahogany and white ash the rest. The actual amount of a wood in an aeroplane is small, but it is selected with much care and the waste is comparatively large. Scarcely any mechanism requires greater perfection in material which enters into its construction, for a defect is liable not only to ruin the machine, but to result fatally to the operator as well.

"The frame is made of spruce. It is necessary that the wood be straight-grained and free from knots and other defects. The strain on an airship is at times sudden and severe, and the machine is so constructed that it distributes the strain equally on all parts. or as nearly so as possible; and the wood is selected with the purpose that every inch of it must stand its part of the strain in critical moments.

"Much care is bestowed on the propellers. It is absolutely essential that they shall have the strength necessary to stand the strain, and at the same time no superfluous weight is allowed. They are sometimes made wholly of spruce, and at other times are built up of different woods. A built-up propeller may

WING BEAMS AND RIBS OF WORLD CIRCLING ADROPLANE, MADE OF SOUTHERN ASH FURNISHED BY THOMAS E, POWE LUMBER COMPANY OF ST. LOUIS

consist of a strip of ash in the middle of each blade, with spruce on each side, then lavers of mahogany outside the spruce and thin pieces of ash outside the hub. A propeller constructed that way is believed to be stronger than one of solid wood. It at least offers the advantage of a more careful inspection of the material. One large piece may have defects within, which cannot be seen, but a propeller made of small pieces offers less chance for hidden defects.

"The pieces are held together with glue. It is claimed that if high grade glue is used and is

well applied, it joins the pieces of wood so firmly that before the pieces will pull apart the wood will break elsewhere. Mahogany is asually employed in making the steering wheels of aeroplanes."

It is safe to predict that a list of ten woods will embrace all that shall ultimately be found to possess the requisite properties for the manufacture of aeroplanes.

Some Second-Growth Prejudices

There is considerable prejudice in New England against whitewood. This is the tree known also as tulip and yellow poplar, but owing to the large amount of sapwood in the second-growth the name whitewood is usually applied. It is claimed by some manufacturers that whitewood is harder to work and causes more trouble from warping and checking than is the case with yellow poplar. As a result the high-grade material is brought in, while the local product is hard to dispose of at a profit. Other manufacturers claim that the prejudice against the wood is not justified and that with proper handling it will fill many of the places of the more expensive poplar. A maker of porch columns uses whitewood and states that it gives excellent satisfaction. Since the future demands for timber must ultimately be met for the most part by second-growth material, a better knowledge of secondgrowth hardwoods seems desirable. Chestnut is one of the most common trees in southern New England, yet many furniture manufacturers will not use it, preferring stock from farther south and west. While there are apparently grounds for this discrimination, it is quite probable that many of the objections could be overcome by improved methods of cutting, handling and selling.

An article appearing in an Illinois country newspaper, describing a recently completed sawmill operation, makes the statement that opens up an interesting possibility in sawmills. In describing the edger, the article says: "With this machine the operator can make any width wanted from two inches to twenty-four inches." Here we have the exceedingly interesting prospect of taking a six, eight, ten or twelve-inch board from the sawmill and after putting it through the magic edger, seeing it come out into a beautiful slab twenty-four inches wide. Truly, all the wonders in sawmilling have not yet been developed.

The Mail Bag

Any reader of HARDWOOD RECORD desiring to communicate with any of the inquirers listed in this section can have the addresses on written request to the Mail Bag Department, HARDWOOD RECORD, 537 South Dearborn Street, Chicago, and referring to the number at the head of each letter and enclosing a self-addressed stamped envolepe.

B 677-Wants Swamp Ash, Mulberry and Black Locust Squares

Louisville, Ky., Mar. 5 Editor Hamwoon Riconn. We have a customer in this city who is just about to start a basefull but factory. He is in the market for swamp asl, mulberry and black locust. He wishes the ash to be 3 inches square v 28 inches long, and the mulberry and locust he wants in squares 23 xx11 inches, and 15 xx9 inches. If you can give us the names of any parties who could turnish us this stock, we would appreciate same.

This concern has been given a list of possible producers of the stock desired. Others wanting the information can have it on application to Hardwood Recent. Editor.

B 678-Wants Yellow Pine Plastering Lath

Williamsport, Pa., Mar. 4. Editor Handwood Recome: Will you kindly furnish me with the names of mills manufacturing 6 foot yellow pine plastering lath?

Hardwood Record will appreciate it if any concern in a position to furnish this stock would write this concern, using the keyed address.—Eurose

B 679-Wants Market for Second-Growth Hickory Dimension

Dennison, O., Feb. 27. Editor Hardwood Record: Can you give us the names of firms that use small dimension pieces cut from strictly second-growth hickory?

This concern has been given the names of prospective buyers of this stock. Others interested can have the address on application to this office—EDITOR.

B 680-Wants Market for Butternut Logs

South Bend, Ind., Feb. 27. Editor Hardwood Record: We have on hand about 50,000 feet fine butternut logs which we wish to cut into lumber, but not being acquainted with users of this material, we will greatly appreciate it if you will give us the names of such firms as you know to be users. Thanking you in advance for your kindness.

This concern has been advised that it will probably be to its advantage to market these logs in log form, and has been given a list of a few prospective customers. Others interested can have the address on application to this office.—EDITOR.

B 681-Wants Names of Manufacturers of Wood Screws

New York, Feb. 28.—Editor Hardwood Record: I shall feel greatly obliged if you will put me in touch with some manufacturers of American wood screws. This inquiry is made for my brother, who resides in London, and who desires to import these goods. Thanking you in anticipation, I am

The writer of the above letter is a responsible party located with a reputable concern in New York. He has been given a short list of wood screw manufacturers in the United States, and if any of our readers are interested they can have the address on application.

—EDITOR.

B 682-Wants to Manufacture White Birch

Syracuse, N. Y., Mar. 3.—Editor Hardwood Record: Can you tell me through your paper what is the best thing to manufacture white birch into? I have a friend who has 12,000 acres, upon which is a large quantity of white birch.

This inquirer has been advised that the wood he probably has in mind is the paper birch, as the real white birch is but a minor species. A great deal of the paper birch is manufactured into spools, spool barrels and spool heads. It is an important item in the manufacture of pails and buckets. It is also used for box manufacture, for porch chairs and for the turned parts of other chairs and similar articles of furniture. It is used for clothespins and quite a quantity goes into the manufacture of crates. Dry

measures are also made from this wood, as are handles of various

Woodenware hoops also furnish a considerable source of consumption for white birch, as do the following: Interior finish, mouldings, saw horses, table slides, wheel parts, washboards and wash benches, Eutron.

B 683-Wants Northern Hardwood, Oak and Gum Squares

New York, Mar. 3. Editor Handwood Ricome: We would thank you to insert the following in your "Mail Bag": We are in the market for inardwood squares 1928(1)2 up to 383, in lengths running from 18 inches to 36 inches, principally 30 inches. We can use these in oak, ash, birch, beech or maple principally, and preferably in oak.

We are also in the market for several cars of gum squares $24_2 x 24_2 x 24$ to 30 inches, sap no defect.

We would appreciate it very much if you could furnish us with the names of mills getting out this kind of stock.

This concern has been advised of the names of several people who are probably in the position to take care of them. Others interested can have the address on application.—Editor.

B 684-Wants Birch Squares

New York, Feb. 27. Editor Hardwood Riccord: Can you give me the names of any manufacturers of birch squares?

This concern has been given a list of manufacturers of northern dimension stock. Those readers interested can have the address on application to this office.—EDITOR.

B 685-Defines "Merchantable Timber"

The following letter has recently been received from an esteemed reader of HARDWOOD RECORD, located in Kentucky. It has to do with a "Mail Bag" item which appeared in last issue, which attempted to define "merchantable timber," at the request of another reader.

The following definition is an unusually clear and concise way of putting it:

Lexington, Ky., Mar. 3.—Editor ILABDWOOD RECORD: We notice an answer to the Philadelphia inquiry as to the definition of the word "merchantable" when applied to standing timber, and we take issue with you on your answer. We agree that it is a difficult matter to draw a strict line defining "merchantable stock."

The writer has always gone on the theory that in the purchase of standing timber, or in the purchase of logs, each particular case should stand on its own footing as regards the term "merchantable." As an illustration: Taking two separate and distinct lots or boundaries of standing timber. One, for the sake of argument, we will admit is twenty miles from transportation facilities; the other lot is ten miles from transportation. The two lots, however, when delivered to the point of transportation are of equal value. The low-grade timber, such as rough oak, rough or scrubby poplar, beech, pine and other cheap woods, standing on the tract twenty miles distant cannot be handled at a profit for the reason the expense incurred in handling will be more than the price at which the manufactured product from these cheap woods could be sold, but could likely be sold at a profit if brought from the tract only ten miles distant.

Both the seller and buyer are presumed to know the conditions, and we think the proper construction to be placed upon the term "merchantable" is where timber, when handled in the most advantageous way, manufactured to the best advantage, and sold to the best advantage, shows a reasonable profit over and above cost of production.

That class of timber, trees or logs when handled, manufactured and sold to the very best advantage that shows a loss or falls to show a reasonable profit over and above the cost of production should not be considered merchantable, and we feel that each particular trade or transaction should stand upon its own footing.

This same question arose between the writer and some other parties owning timber in eastern Kentucky. The writer insisted on a clause readine as follows:

"For the purpose of this agreement, the term 'merchantable' is understood to be and means that class of timber, when handled, manufactured and sold to the best advantage, will show a reasonable profit over and above cost of production."

B 686-Wants Grape Crates Knocked Down.

Lockport, N. Y., Mar. 5.—Editor Hardwood Record: Can you give me the address of any firms in the East that make a business of selling box boards of any required dimensions? I wish to get some crates about one foot square on the ends and two feet long, ends to be made of elm and slats of basswood, preferably. I would like good clean stock, knots allowed if they are sound. The crates are to be shipped in a knock-down condition with the exception of the ends, which are to be nailed up. Boards are to be surfaced one side. Crates are for use in the shipment grange.

This inquirer has been given the names of several people who could possibly get out this stock. Others interested can have the intormation upon application to this office. Editors.

B 687-Wants Addresses Southern Handle Manufacturers

Cleveland, O., Mar. 5. Editor Harnwood Riccome: We are interested in obtaining the addresses of handle manufacturers located in Louisiana and other points in the South. We are manufacturing automobile jacks and would like to get in touch with people making such handles. Will you kindly give our wants publicity in the columns of Harnwood Record?

A list of producers of the stock asked for has been supplied. Anyone having this material, and desiring to be placed in touch with the inquirer, may have the address upon request.—Editor.

B 688-Wants Several Cars Brown Ash

New York, N. Y., Mar, 5. -Editor Hardwood Record: Can you give me a list of manufacturers of brown ash? I would like to get about three ears of 4 firsts and seconds, and one car 5.4 firsts and seconds.

Manufacturers of brown ash interested in this inquiry, may have the address upon application.—Editor.

B 689-Wants Second-Growth White Oak for Spokes

Tell City, Ind., Feb. 28.—Editor Hardwood Record: We are at this time in the market for a good many 1¾ "x2¾" and 2"x3" second-growth white oak pieces, all of good forest growth. Could you put us in touch with this?

The address of our correspond will be sent oak producers anxious to get in touch with this prospective customer.—Editor.

Clubs and Associations

Annual Meeting Northern Forest Protective Association

On Tuesday, March 3, the Northern Forest Protective Association held it. third annual meeting at Marquette, Mich. The business session was held at the Marquette Club beginning at 11 o'clock in the forenoon, at which time the reports of the officers were read and the board of directors was elected for the ensuing year. At 1:30 the business session reopened at the Marquette Opera House, this session being open to the public. Among the interesting features was a lecture on the Forests of Alaska given by R. S. Kellogs, secretary of the Northern Hemlock and Hardwood Manufacturers' Association, which was illustrated by about ninety lantern stides.

A feature film obtained by the Federal Forest Service and representing the origin, rapiu development and results of a forest fire, which was shipped from California to the association for exhibition, was displayed after Mr. Kelloge's address.

Several addresses and papers upon subjects patent to the work of the association were well received.

A cordial invitation was extended to the people of Alger county to attend the meeting, and those who took advantage of this invitation were well repaid

Annual New Jersey Lumbermen's Protective Association

The New Jersey Lumbermen's Protective Association held its twenty-ninth annual meeting at Newark February 24. The chief topic brought up was the suit of the government against the eastern states retail lumber dealers' associations and this was reviewed in detail. In his annual address Pres. Rudgers dwelt on the rights of the retailers to take steps to conserve their business against attacks by wholesale competitors. The decision of the lower court did not forbid the exchange of information between two or more parties, but only forbade the associations from combining to circulate their reports. In the final analysis, he said, it was a question of whether the retailers had the right to refuse to buy from their competitors.

The board of directors reported on the year's work and showed few complaints of sales made by wholesalers. The lien law which the association has sought for a long time to have changed was also discussed, the directors reporting that a new bill had been drafted which will be an improvement over the present one, if passed, which seems likely.

In the evening the annual dinner was held at the Cafe Washington. The diners were furnished with paper caps and all hands joined in to make the occasion one of real good cheer. The attendance at the dinner was swelled by a number of wholesalers.

Monthly Meeting of the Lumbermen's Club

On last Monday night, March 2, the regular monthly meeting of the Lumbermen's Club of Cincinnati was held at the club's new headquarters, the Hotel Gibson. A large number of Cincinnati lumberman sat down promptly at 6:30 p. m. to a full course dinner which was much enjoyed. After dinner President Hagemeyer called the meeting to order. One of the first things done was the ordering of some flowers sent to the home of W. A. Bennett, one of the club's oldest members, who has been on the sick list but is now improving to some extent.

Alex Schmidt of the Francke Lumber Company brought up the matter of the proposed charge of \$2.00 per car for the spotting of cars, both loaded and empty, on private sidings and entered a protest against this extra charge. The result was that a committee, consisting of Fred W. Mowbray, chairman; Alex Schmidt, J. S. Zoller, J. E. Davidson and Geo. Morgan, was appointed to take the matter up with the railroads and the Interstate Commerce Commission if necessary, protesting against the charge. The same action is being taken by manufacturers in other lines of business likewise affected.

At this meeting under the constitution of the club it is necessary to appoint nominating committees to mominate candidates for the various offices, to be elected at the annual meeting in May. The chair appointed the regular committee, consisting of Chas, F. Shiels, Ralph McChacken and Harry R. Browne, and the floor selected the following members to act as an independent committee: Emil Thoman, chairman; Wm. Dublineier and Geo. Morgan. These two committees are to make the nominations and report at the April meeting their selections and then the campaign will be on in earnest. Usually these elections are very spirited, but always friendly, and the result has always been a very competent set of officers.

The club was fortunate enough to have as its guest Edwin J. McIntyre of Toronto, Canadia, a representative of the Canadia Lumberman and the Canadian Woodworker. After all of the business of the evening had been disposed of President Hagemeyer introduced Mr. MacIntyre, who delivered a very instructive address. He touched mostly on business conditions throughout Canada as he found them in his recent travels through that district, and stated that that section of the country has had its depression just like the balance of the country, but that now the business men of Canada are much encouraged and feel that the conditions are improving rapidly and that at least average business will be obtainable by early spring and growing steadily better as the season advances. Mr. MacIntyre predicts a splendid business for lumbermen during 1914.

Annual Meeting National Manufacturers to Be Held During Exposition

Secretary J. E. Rhodes of the National Lumber Manufacturers' Association, announces that the twelfth annual meeting of that organization will be held in connection with the Forest Products Exposition in the Coliseum, Chicago, May 5 and 6. This idea is surely a good one, as the National Manufacturers' Association is the sponsor of the exposition proposition, and by holding this meeting in this way, in connection with the exposition itself, it will give no little moral support to that project.

This is the second organization which has decided to hold a meeting in connection with the exposition, the other being the Northern Hemlock and Hardwood Manufacturers' Association, made up of Wisconsin and upper Michigan operators.

Philadelphia Golf Association Holds Tournament at Richmond, Va.

Horace A. Reeves, secretary of the Lumber Trade Golf Association, Philadelphia, announces that at a meeting held at the Union League at Philadelphia, February 21, it was decided to hold the annual tournament of the Lumber Trade Golf Association at the Country Club at Richmond, Va., May 26 and 27. This club extended to the association an invitation, including free use of the club house and course, from May 26 to 27, and members are invited to avail themselves of this privilege.

A large attendance is anticipated and it is believed the function will be one of the most enjoyable ever held.

Wood Preservers' Bulletin

The American Wood Preservers' Association, with headquarters at Baltimore, Md., has begun the publication of a quarterly paper devoted the interest of the timber treating business. F. J. Angier, secretary of the association, is editor; C. C. Schnatterbeck, managing editor, and all members are contributing editors. The initial number contains eight pages of news and comment of interest to members and the general public.

Lumber Cut and Shipments

The National Lumber Manufacturers' Association has sent out a statement showing cut and shipments of lumber in January, 1914, compared with 1913. The figures were compiled from figures furnished by affiliated associations and mills not members of associations. The total cut in January, 1913, was 751,600,000, in 1914, 704,400,000; shipments in 1913 amounted to \$26,900,000, and in 1914, 752,000,000.

amounted to \$26,900,000, and in 1914, 192,000,000. Decrease in cut during January, 1914, under January, 1913, 47,200,000 feet Decrease in shipments during January, 1914, under January, 74,900,000 feet Excess shipments over cut during January, 1913. 75,300,000 feet Excess shipments over cut during January, 1914. 47,600,000 feet

New Factory for Steelton, Mich.

It is reported from Steefton, Mich., that there will shortly be erected at that point a factory for the manufacture of hardwood products, which will represent an investment of \$20,000. This concern has negotiated with authorities at Steelton asking for the usual concessions regarding free sites, tax exemptions, etc., and indications are that the deal will soon go through.

The new industry will represent the investment of several outside capitalists, and will probably employ from twenty to thirty men.

With the Trade

Old Furniture Plant to be Remodeled

Work has been started on installing machinery and remodeling the plant of the Iowa Furniture Manufacturing Company, Clinton, Iowa. The plant was formerly the Ingwersen Manufacturing Company. The new owners have announced that the furniture factory will be devoted to the manufacture of chairs, mostly dining room chairs. With the installation of the new machinery, the plant is to be enlarged and the present machinery will be so arranged as to secure greater efficiency

Hardwood Flooring Plant at Newberry, Mich., Soon to Start

At the end of this month a new hardwood flooring plant now being completed at Newberry, Mich., will be in operation. Construction on the buildings has been pushed, and the installation of the machinery will be rushed with all possible speed. William Horner, who has operated a flooring plant at Reed City. Mich., for many years, accepted the proposition of the business men of Newberry, who offered a bonus of \$5,000 for the location of a branch factory at this city. The buildings will cover a considerable area and are all of brick and steel construction. Provision has been made for the growth of the business.

The main building, in which three flooring machines are installed, is 70x220 feet. Two other machines will be installed later. The dry kilns occupy an area of 80x100 feet. The mill with its three present machines will have an output of 40,000 feet of finished flooring daily, which output will be increased to 65,000 feet when the other two machines are installed. The plant will be operated day and night for some time to come, and will employ a force of from sixty to seventy five men at the start.

New Plant for Manistique, Mich.

Through the efforts of the Manistique Commercial Club a deal has been closed which will insure to that city another woodworking factory which will turn out broom handles, chair rounds and similar products, made from maple, birch and beech. The new enterprise will represent an investment of about \$250 000. The deal was closed between Manistique interests and Frank Sherke of the lower peninsula.

The plant will be located at Manistique in the spring, and will give employment to twenty-five or thirty men who will work the year round.

Felger Lumber and Timber Company Incorporation

On March 2 the Felger Lumber and Timber Company was incorporated, with a capital stock fully paid in. The principal place of business will be at Grand Rapids, Mich. At a meeting of the stockholders held on this date the following board of directors was elected: Otis A. Felger, Will R. Smith, Will L. Fassett, Earl H. Felger, George W. Ingram. Later at a meeting of the board of directors, the following officers were elected: Otis A. Felger, president; Will R. Smith, vice-president and manager; Will L. Fassett, secretary; Earl H. Felger, treasurer.

Mr. Felger, president of the company, is secretary and treasurer of the Memphis Band Mill Company at Memphis. Mr. Smith was vice-president and manager of the Stearns company of this city for several years; therefore his present line of work is somewhat familiar to him. Mr. Fassett, the secretary of the company, has been associated with Mr. Felger for a number of years. Earl H. Felger is a son of Otis A. Felger and has been connected with the Felger Lumber and Timber Company for the past year. Mr. Ingram was formerly connected with Henry G. Dykehouse

The Felger Lumber and Timber Company has been operating here for the past three years as an individual enterprise, handling northern and southern bardwoods. The new corporation will continue handling the same woods as before and will add to its line northern and southern pine and hemlock.

Boston Concern Moves to Canada

The Atlantic Lumber Company, Inc., whose head office has been at Boston, Mass., announces that it has moved to 110 Manning Chambers, Toronto, Ontario, Canada. This concern manufactures southern hardwood lumber and bas mills at Knoxville, Tenn., Walland, Tenn., and Franklin, Va. The purpose of the move is probably to gain a stronger foothold with the desirable Canadian trade

Big St. Lawrence Project of William Whitmer & Sons, Inc.

One of the most extensive and promising enterprises of recent date is that of the St. Lawrence Pulp and Lumber Corporation, of Canada, financed and controlled by William Whitmer & Sons, Inc., and the banking houses of Chandler & Co., Inc., and W. F. Fuqua & Co., all of Philadelphia.

The company acquired timber rights, held under ('rown grant, to a tract of some 640 square miles of spruce, balsam, cedar and birch timber and pulpwood located in the counties Gaspe and Bonaventure, province of Quebec, a veritable empire of timber. Its mills are located on Chaleur Bay (an arm of the Gulf of St. Lawrence), at the mouth of the Grand Pabos river, which itself forms a spacious bay. Before the tract was taken over by the St. Lawrence company the interests affiliated with its organization took the first essential step and had the tract cruised by a firm of expert timber estimators, Messrs, Le Mieux Bros, & Co., of New Orleans, La.

The property acquired presents practically ideal physical features for a joint lumber and pulp operation. The main physical features in the success of a proposition of this kind are: First, quantity and quality of raw material (timber and pulp wood); second, workability (ability to get the raw material out of the woods to the mills at proper cost); third, accessibility of the principal markets for the product. All of these features are possessed to a remarkable degree by the St. Lawrence property.

With regard to the timber contents, Messrs, Le Wieux Bros, & Co. report that, "the quality of the timber is very good, and much superior to anything that we have heretofore estimated in the Province of Ouebec, or in Nova Scotia, or in New Brunswick, in all of which we have done a great deal of work in the timber. We have found a great area of this tract to be virgin forest; the timber along some of the streams has never been touched. The timber consists of spruce, balsam, cedar, white and yellow birch and scattered white pine. Disregarding the pine and birch, we estimate the quantities of timber on the tract log scale, Quebec rule, as follows:

Balsam1,212,000,000 feet Spruce 969,600,000 '

Total merchantable timber.....2,302,800,000 We consider both the above estimates as very conservative, particularly

CENTLY INCORPORATED FELGER LUM-BER AND TIMBER COMPANY, GRAND RAPIDS, MICH.

OTIS A. FELGER, PRESIDENT OF THE RE- WILL L. FASSETT, SECRETARY OF THE RE- EARL H. FELGER, TREASURER OF THE RE-CENTLY INCORPORATED FELGER LUM-BER AND TIMBER COMPANY, GRAND RAPIDS, MICH.

CENTLY INCORPORATED FELGER LUM-BER AND TIMBER COMPANY, GRAND RAPIDS, MICH.

the pulywood estituate. In estimating pulywood, in order to be entirely conservative, we have stated it to be ten cords per acre. Practically, there is an ite ost unfinated supply of pulywood on this land, enough to turn out easily from 60,000 to 100,000 cords per year. The property could easily support three sawnills of a capacity of 100,000 feet per day each."

In relation to the question of fire risk to standing timber, the St. Lawtone company is especially fortunate, for the property is in the Gaspe peninsula, which is completely surrounded by salt water, and is in that northeastern section of Canada which is subject to frequent and heavy fogs. The underbrush is kept so well dampened that the possibility of damaging fire is so remote that it may be disregarded.

As regards workability, the St. Lawrence property is equally favored. The tract is traversed by four main rivers, namely, the Grand Patons, the Liftle Patons, the West river and Port Daniel river. The timber is such that logging by railroad is also very convenient. This latter course has been decided upon as the best method for the development of the property. The land is hilly, but not rocky. There are no broken or barren spaces, and on account of its freedom from rocky ledges it is heavily timbered, even on the tops of the highest hills. The land slopes back from the rivers at comparatively easy grades to large plateaus from 500 to 1,000 feet above the streams. Some of these plateaus are three or four miles in width. The soil is a rich, dark red sandy loam.

As to accessibility of markets, the property is accorded the double facili tics of steam railroad and ocean transportation. It is four days distant from New York by water and two or three days by rail. The Atlantic, Ouebec & Western railroad passes near the mills, and steamers can be loaded at Rails' wharf, which is near the company's mills and is reached by its railroad. The St. Lawrence property is nearer in point of time to New York than the timber fields of West Virginia. Plans now being carried out provide for a sawmill of 150,000 feet per day capacity, a sulphite pulpmill of 100 tons per day capacity, a standard gauge railroad connecting with the A., Q. & W., Rails' wharf, the company's mills and entering and traversing the timber limits. The sawmill should be ready for operation early next spring and the pulpmill somewhat later in the summer. About nine and a half miles of the railroad, including terminal trackage, has been comuleted and it is now in operation into the timber limits, reaching Camp No. 1. The mills and town site are located on the northeast shore of the Grand Pabos Bay, and are ideally situated from an operating standpoint. The sawmill and pulpoill face each other on the sides of two adjoining hills. An arm of the bay runs in between them and is being dredged out to form a hot pond, into which the logs will be dumped and later drawn out for the sawmill or pulpmill. The town of Chandler, which has been built by the company, includes a bank (branch of the Bank of Nova Scotia), a hotel, company construction offices, two large general stores, storehouses. stables, about forty dwellings, etc. The present equipment now on the ground includes one 70-ton Shay cog-drive locomotive, one American Locomotive Company direct drive line engine, five steel flat cars for logs, one American log loader, with steam shovel attachment, one tugboat, barges, etc. Thirty additional steel log cars have been ordered.

An Unusual Planing Mill

In this connection is shown a photograph of the recently completed planing mill of the G. H. Evans Lumber Company, manufacturer and wholesaler of hardwoods and yellow pine, located at Chattanooga, Tenn. This mill has a daily capacity of 100,000 feet.

As can be seen from the photograph, the layout of the Evans plant is sciellent and gives ample provision for expeditious and satisfactory handling of its large export and domestic business.

G. H. Evans, head of this concern, has been one of the foremost sponsors

or red gum. He has made a close study of this wood and its adaptability for the various purposes to which it is being put. He also has made a close analysis of the best methods of treatment under various conditions, all of which information he has incorporated in a little pamphlet recently issued, which could very well serve as a hand book on the proper handling of red gam, as it contains a great deal of new and extremely valuable information. Mr. Evans advises Hardwood Record that if any of its readers despect to secure this information he will be very glad to send out the pamphlet.

Changes Its Office

The Vicksburg Export Lumber Company, formerly of Vicksburg, Miss., manufacturer and exporter of southern hardwood, express and yellow pine, announces that since March 2 its Vicksburg office has been abandoned, as the company has taken over a band mill operation at Jackson, Tenn. The business will henceforth be conducted from the Jackson office under the style of the Missispip Hardwood Company.

Ferd Brenner Plant Begins Operations

Interest in the new sawmill of the Ferd Brenner Lumber Company of Alexandria, La., which has been in the process of building for some little time, has been keen. This plant, which is modern in every particular and employs a great many unusual features, began operations the early part of this month. The mill building is sheathed with galvanized corrugated iren and is built on concrete foundations. The Presort Company of Menominee, Mich., furnished the seven foot band mill and other sawmill equipments, including the band resaw. It is expected that this plant will have a daily output of from 40,000 to 50,000 feet of hardwood.

W. Brown Morgan Soon to Leave Memphis

W. Morgan Brown will, on April 1, after fitteen years as secretary of the Anderson Tully Company and one of the most prominent figures identified with the manufacture of standard packages from sawn shooks and veneers, leave Memphis to become president and treasurer of the Morgan Vencer Company, which has recently been incorporated under the laws of Arkansas, which is capitalized at \$100,000 and which will have its plant and general headquarters at Pine Bluff, Ark. The notice of this incorporation appeared in a recent issue of Hardwood Record. The other officers are: J. F. McIntyre of J. F. McIntyre & Sons, vice-president, and H. B. Strange cashier of the Peoples Savings Bank, Pine Bluff secretary The company is rapidly completing its plant which will be up to date in every respect, including sufficient dry-kiln facilities to take care of the daily output of two cars of single ply, rotary cut gum veneers. This will be in readiness for operation between May 1 and 15. Mr. Morgan will make his headquarters at Pine Bluff, but will leave his family in Memphis for the time being. Later, however, they will join him at that point. The company has assured itself ample raw material through a contract with the McIntyre-Mann Timber Lands Company, whereby it secures all the gum stumpage on the timber owned by that firm.

Mr. Morgan has been prominently identified with the Lumbermen's Crub of Memphis, the Southern Hardwood Traffic Bureau and the Business Men's Club, serving the first for some years as a member of the river and rail committee, being now a member of the board of managers of the second, and having rendered signal service to the last named in connection with traffic matters. He has also come into national prominence through his position as chairman of the National Classification Committee of Wooden Box Interests, which has made a strong fight for equal

THE WELL-ARRANGED PLANT OF THE G. H. EVANS LUMBER COMPANY, CHATTA-NOOGA, TENN., GUING AN EXCELLENT VIEW OF THE PLANING MILL, THE SHIPPING ARRANGEMENTS AND THE EXTENSIVE YARD.

W. BROWN MORGAN, PRESIDENT AND TREASURER OF THE MORGAN VENEER COMPANY, PINE BLUFF, ARK.

rates on goods shipped in wooden packages with these shipped in containers made of fiber, strawboard and other in it trac-

Owing to the fact that he is so popular and that he is a man of such undoubted ability, there is genuine regret among his many friends and associates here over the change in his business plans which makes Memphis loss him as a cutton.

Cartier-Holland Lumber Company Moves Head Office to Grand Rapids, Mich.

The Cartier Holland Lumber Company of Ludington, Mich., sends the following self-explanatory letter to the trade:

"For the convenience of our distorers and to ging us in personal contact with them, we thought it advisable to move our sales office to Grand Rapids, and our new location will be Suite 731, Michigan Trust building.

"E. M. Holland will be in charge of the Grand Rapids office. On account our mill cut not being completed, it will be absolutely necessary for C. E. Cartier to remain at Ludington, but it is his intention to become a resident of Grand Rapids at the completion of the cut at Ludington, even though the plant is moved elsewhere.

"Our being on the ground at Grand Rapids we hope will be a benefit to our customers and the trade in general, as we will be able to give them better service and will have a better understanding of what they require. We will be daily in communication by wire with the mill at Ludington in order to facilitate the prompt handling of everything, especially the urgent matters. We will hold open house at all times and would appreciate very much if our friends will take advantage and call."

The Cartier-Holland Company has been cutting for some time on its splendid new mill at Ludington and has been fortunate this winter in striking some exceptional logs. The mill is a really model plant in every way and the quality of the stock it has been turning out is absolutely above criticism. The new arrangement should place the concern in an even better position to give satisfaction to its trade.

Accepts Position as Sawmill Superintendent for John B. Ranson & Co.

Olin White, manager of the Nashville branch of Wistar, Underhill & Nixon of Philadelphia, has resigned that position and accepted the position of superintendent of the sawmills of John B. Ransom & Co., also of Nashville. Mr. White located at Nashville five years ago when he originally Installed the yard for Wistar, Underhill & Co., as the concern was then styled. His efforts to build up a business in Nashville have been unusually successful. Mr. White was formerly located in New York City, being connected with the lumber department of Brunswick-Balke-Collender Company. His acquisition by John B. Ransom & Co. should be to their distinct afwantage.

Mr. White is succeeded by Ed Underhill, a nephew of F. S. Underhill, who has been Mr. White's assistant at Nashville for some time. It is generally conceded that his elevation to the management of the Nashville yard is justly deserved.

W. A. Passmore Lumber Company Organized in Alabama

The W. A. Passmore Lumber Company is the style of a recently incorporated concern, with offices at New Market, Ala. W. A. Passmore is president; Frank Pearson, secretary, and T. J. Gentry will superintend operations. This company owns 2,000 acres of fine virgin hardwood timber in the vicinity of New Market and will install an up-to-date 6-foot band sawmill with the necessary appurtenances. This mill will cut over 15,000 feet daily, and in addition the company will do more or less in the wholesale business.

Mr. Passmore formerly was vice-president and manager of the lumber department of the McMinnville Spoke & Lumber Company at McMinnville, Tenn.

R. J. Darnell's New Plant Ready to Start

One of the officials of R. J. Darnell, Inc., is authority for the statement that steam will be started this week in the big engine that is to drive the double band mill and resaw now practically completed at Batesville, Miss. It has been in process of construction for a number of months, in fact, ever since the plant was burned here last year and the decision was reached to rebuild it at Batesville instead of Memphis. Mc-Donough band saws and resaw have been installed and the equipment throughout is heavy. One big engine will run both the band mill and the resaw and will likewise furnish the motive power for the veneer machinery which is to be installed. The latter will be set up at the rate of two machines at a time until a battery of twelve has been completed. The plant will have a very large capacity and has been built at heavy cost. About 1,000,000 feet of timber has been gotten out already and facilities have been established, including the building of the Batesville Southwestern, that insure a steady supply of logs for the big mill. The firm owns nearly 20,000 acres of hardwood timber lands in that section and will draw on these for the necessary raw material. About 150 men will be given employment, all told. Harry Darnell resides at Batesville and will have general charge of operations there. He will be assisted by Roland Darnell, a brother, with headquarters at Memphis. R. J. Wiggs, one of the officials of the company, will have charge of the sales end of the business not only for the plant at Batesville but for the mill of the Darnell-Love Lumber Company at Leland, Miss. R. J. Darnell, head of the two firms, will look after the financing of operations at both points. The mill now about to start at Batesville was one of the landmarks at

BIRCH IS UNSELECTED. RED ALL IN.

Above stock can be assorted as to grades. Can saw out on contract well boxed maple timbers and plank.

THE QUALITY OF YOUR VENERS

Your profits depend largely on economical production, and uniformly cut veneers lessen the cost of production.

Our employes are experienced, our machinery modern, and we use the best selected logs in Mahogany, Circassian Walnut and Quartered Oak.

Therefore, we will furnish you with absolutely uniform and bone dry sliced or sawed veneers that your men can handle with a minimum outlay of time and labor.

This Means Money in Your Pocket

We will welcome you to our plant (which is so modern it's worth coming to see) or we will send a representative with samples, on request.

cost of the line and it is regarded as highly probable that negotiations will result in the sale of the property to the Illinois Central system.

Proposed Mutual Casualty Company in New York

Lumber interests in New York prominent in the National Wholesale Lumber Dealers' Association and also in the Lumber Underwriters. a fire insurance organization specializing in lumber risks, are taking steps toward the formation of a mutual casualty insurance company. The new compensation law becomes effective July 1 and as its provisions make it compulsory for employers within the state to insure themselves against accidents to employes, a company formed and operated upon mutual lines should prove of benefit. The law provides various forms of insurance, such as the state fund, mutual associations, mutual companies and casualty companies. The idea of those interested in the New York proposal is to give lumbermen of the state the best and most equitable liability insurance. A specializing mutual company will doubtless prove popular in the lumber trade. All the men behind the proposition are lumbermen with large experience in the insurance field. To many the question of this kind of insurance is entirely new, and for the purpose of discussing it in all its phases a meeting will undoubtedly be called.

New Cincinnati Timber Company

The Tennessee Timber Company is the style of a recently incorporated concern which has taken offices in the Second National Bank building. Cincinnati. Hall Hagemeyer is general manager and has full charge of the sales. Mr. Hagemeyer is vice-president of the Harriman Hardwood Lumber Company. The new concern will market the production of hardwood of the Harriman Hardwood Lumber Company, Harriman, Tenn.

New Chair Company at Rome, Ga.

The Rome Chair Company has started operations at Rome, Ga., and, as indicated by its name, will manufacture chairs. This concern is capitalized at \$10,000. The company has purchased the site and factory buildings of the old Chickamauga Manufacturing Company in North Rome. The machinery has been installed. In addition to its line of chairs, the company will manufacture lounges, davenports, porch furniture, swings, etc.

Stemmelen Lumber Company Locates Yard at New Albany.

The Stemmelen Lumber Company of Louisville has leased a tract of ground north of the Monon passenger depot at New Albany, Ind., and will maintain a yard there as a shipping point. A force of men was recently engaged in putting the tract in shape and loading and unloading platforms are being erected alongside the tract for the handling of the company's shipments. The Stemmelen Lumber Company is engaged in the wholesale hardwood lumber business, B. F. Stemmelen being president. The company will employ from fifteen to twenty men in its new yard.

Veneer Plant at Hancock, Mich.

The Widner-Johnson Company of Alpena, Mich., has been seeking information concerning the location and prospects of a veneer plant in or about Hancock. The main question raised by this company is regarding the supply of bird's-eye maple logs. If the company's demands in this particular could be met it would probably favor locating somewhere near Hancock. As there is plenty of this class of material in that country, the prospects are that Hancock will secure a new industry.

Cicero Timber and Lumber Company

The Cicero Timber & Lumber Company of Grand Rapids, Mich., has filed articles of association, with a capital stock of \$36,000, fully subscribed. The stockholders are Emily J. Clark, Marguerite Wurzburg, Edward J. Clark, Sarah A. Clark, Josephine Bowen, Frank Clark, Gertrude C. Partridge, Edith C. Sligh, Irving M. Clark, Sarah A. Cole, Sherman Robinson, Esther L. Robinson, James French, Otto French, Howard French and Emily Heiss.

New Concern for Grand Rapids, Mich.

The Michigan Cabinet Company, the Kakorost Company and the Benedict Clamp Company have been merged as the Grand Rapids Handscrew Company of Grand Rapids. The capital stock is \$250,000, all but \$56,000 of which is preferred. Manufacture in the furniture line will be confined to manual training equipment, laboratory furniture and domestic science and factory furnishings. P. B. Schravesande is president; B. M. Fox, vice-president : G. W. Fortier, treasurer, and W. B. S. Matheson, secretary,

Kentucky Lumber Company Moves to Lexington, Ky.

The Kentucky Lumber Company of the First National Bank building, Cincinnati, O., will move its general offices to Lexington, Ky., where it will open up quarters in the Security Trust building on April 1. The Cincinnati offices will be closed on March 31, although the company will be represented in Cincinnati territory by L. F. Violett, who will cover Obio and Indiana trade, maintaining headquarters in Cincinnati. General Manager W. E. Delaney and Secretary and Treasurer Ralph McCracken will remove their families to Lexington as soon as they can make the necessary arrangements. The new office will occupy about twice the space maintained at Cincinnati and will consist of a suite of six rooms.

The reason for this change in location is a desire on the part of the company's officials to be near the manufacturing end, which will be carried on at Burnside and Williamsburg, Ky., and Lafollette, Tenn.

The removal of the Kentucky Lumber Company's interests and personnel

from the city of Cinemanti will be a severed, one to the Cinemanti lumber trade, as that company's interests have been one of the most important factors in the upbuilding of the Cinemanti trade. The members of the Kentucky Lumber Company have taken an active and prominent part in all the doings and the building up of the Cinemanti Lumbermen's Club, and their removal will be severely felt.

Most of the present employes of the Kentucky Lumber Company will move with that concern to its new quarters. In addition, J. C. Shuck of Pittsburg, Miss., will take the position of assistant sales manager. Mr. Shuck is already breaking in at the Cincinnati office and will go with the company to Lexington. He has been connected with the Houston Brothers Lumber Company of Vicksburg, Miss., for a long time and has had a broad experience, particularly in sales.

Penn State Foresters Return From Annual Lumbering Trip

Among the many instructive things for P un State Foresters on their annual lumbering trip to northern Pennsylvania and the Adirondacks were the special talks given by H. P. Welsh, general superintendent of the Central Pennsylvania Lumber Company mills, on "History of Hemlock Milling in Northern Pennsylvania," and John L. Graham, mill designer, operator and constructor of Reynoldsville on "Development of the Gang Saw and Its Piace in the Milling World."

The Barringer Brake, manufactured by Ryther & Pringle Company, Carbinge, N. Y., was seen in practical operation on the holdings of the Santa' Clara Lumber Company, and was carefully demonstrated as to its merits by Mr. Gilbert, vice-president of the company manufacturing the brakes, who was with the party as guests of the Santa Clara Lumber Company at its camp on Cold river, near Tupper Lake, New York.

Many forest products plants were visited on the trip in both Pennsylvania and New York, among which were the chemical distillation plants at Walton and Lyman Run, Pa., the basket factories at Penn Yan, N. Y., and the Brooklyn cooperage plant at Faust, N. Y.

An important feature of the trip were the visits to several of the state plantations in both New York and Pennsylvania.

Mrs. Lillie Grace Johnson

On Tuesday, March 3, Mrs. Lillie Grace Johnson, wife of C. W. Johnson, president of the St. Louis Basket & Box Company, St. Louis, Mo., died at her home. Mrs. Johnson, who was formerly Miss Schearer, died at the age of forty-eight years. The funeral was held Thursday, March 5, at 2 p. m. at the residence, 3080 Hawthorne boulevard.

Pertinent Information

Annual Lumber Statistics

The Bureau of the Census has quit collecting and publishing annual statistics of lumber cut in the United States. For many years past information along that line has been compiled at regular intervals and has been furnished to the public. It showed how much lumber was cut in every state, the different kinds and the quantity of each kind. Persons interested in the lumber business have looked forward every year to the receipt of that information and have appreciated it.

Some months ago word went out that the Census Bureau contemplated discontinuing this service. Protests went to Washington from hundreds of lumbermen, and the bureau was urged to reconsider the matter. It was hoped that favorable action would result, but that hope has not been realized. The final decision was that the annual compilation of lumber statistics should end with the year 1912. The report from that year has been appearing in installments for some months.

After the Bureau of the Census withdrew from the work, the Department of Agriculture was urged by lumbermen to take it up. The latest announcement is that it will do so, but that the statistics thus compiled must be in a somewhat abbreviated form. Hardwood Record has received one of the information cards which will soon be sent to lumbermen in all parts of the United States. The questions asked are short and simple. The chief information sought includes the kinds of wood sawed and how much of each.

Mill owners will doubtless appreciate the efforts being made to collect data, and will assist by promptly filling the blanks and returning them.

The work is being done by the co-operation of the Forest Service and the Bureau of Statistics, both belonging to the Department of Agriculture.

Submerged Forests of Oak

It appears that arrangements are being made to recover extensive forests of submerged oak in Russia. A company has been formed in England for that purpose. About a year ago Hardwood Record described a piece of the wood which it received from Russia. Further details of the extent and location of the submerged oak have been received. The timber lies at the bottom of the Moksha river, a tributary of the Oka, which runs into the Volga at Nijni Novgorod. The discovery was made by Colonel Petrer Ivanoff, of the Russian Naval Diving Corps, and owner of property along the river bank. It is stated that the bed of the river is paved with immense logs of oak for a distance of nearly 500 miles. The existence of logs has long been known to the neighboring peasants, and for generations they have fished up logs whenever they wanted to build a cottage, a cow-house, or to make new furniture. But the first to turn the forest

to practical account on an extensive scale appears to be Colonel Ivanoff, who obtained a cone-siton from the Russian government and secured the rights of the riparian owners for a distance of 450 miles along the Moksha. The wood is dark grey, bordering on black, as if it had been impregnated with creasote; but the grain of the wood is distinctly visible, and there is no sign of either petrification or rot. The wood is apparently quite fit for cabinet work, paneling, etc., and it is mainly to these purposes that the directors of the company hope it will be devoted. It is suppessed that the forest has lain under the water for at least 1,000 years, and that the cause of the submersion was volcanic. One of the finest theaters in Moscow has been finished with this oak, rubbed with goldleaf.

Building Operations for February

Returns of building operations for February in sixty cities, officially received by the American Contractor, Chicago, reach a total of \$41,173,253, as compared with a total of \$41,178,195 in the same cities for February, 1913. The comparison shows a difference of only a small fraction of one per cent. Trade a year ago was regarded as active and the showing must therefore be regarded as favorable. There are the usual fluctuations in different cities, thirty showing gains and thirty losses. Among the cities making the most favorable comparisons may be mentioned the following with their percentages of gains: Detroit, 92; Kanass City, 116; Manchester, 94; Duluth, 76; New Haven, 197; Peoria, 321; Pittsburg, 161; San Antonio, 354; San Francisco, 252; St. Paul, 70; South Bend, 411; Topeka, 82; Wilkes Barre, 64.

For two months the totals are \$\$1.347.364, as compared with \$80,646,849 for the corresponding period last year, a gain of one per cent. Details are

African Mahogany Market

The London Timber News in its issue of February 7 says that the outstanding feature of the African mahogany market is the large quantity that has gone into consumption during the past month. It was thought that the larger imports would reduce prices considerably, but this did not turn out to be the case, owing to the very strong demand that has been experienced for home and foreign consumption. It is somewhat remarkable that the large number of highly defective logs which have been received from the west coast during the last two or three months have found ready buyers at corresponding prices in the home market. There is always a demand here for mahogany that can be sold cheaply, irrespective of the condition of the logs. Buyers of this class of wood came forward and practically cleared the market, and this left board logs a much better chance of realizing their full value. Quite apart from the larger imports, the demand for board and panel logs has improved considerably, so that for all

practical purposes it can sately be said that prices of the better qualities of African mahogain have been well maintained. In fact, first class board logs are, comparatively speaking, selling at the same prices which they realized better this big rush of logs came in

The demand is collectively good and is still unsatisfied, so that the logs now coming on the market are fairly sure of a good reception. There is still time for some slight easing in prices, owing either to further very heavy arrivals or the inability of the market to absorb the quantities com ing along, but even if this should take place, it can only be of a temporary nature. As soon as the supply shows any signs of contracting, prices may be expected to move upward, and it is pretty certain that such conditions will rule until the beginning of the next import season in September. A feature which should not be lost sight of by all interested in African ma hogany is that the last rainy season on the West Coast was a very good one-better, in fact, than has been experienced for years, and it is said. with what truth we know not, that good rains are seldom experienced two years in succession. In the case of figured logs, the market is still very strong, and those showing good to fine character have found buyers at full prices. The market could absorb larger quantities of figured wood than have been coming to hand recently,

Many Uses for Oak and Ash

The London Tunber News says that to the uninitiated in these matters, the vast quantities of oak timber that are annually cut up to keep pace with the trade for boards and all other converted wood sizes seem out of all proportion to the number of trees that are annually felled. But then it must be remembered that an oak tree of, say, fifty cubic feet content will cut into a very large amount of boarding, posts, poles, or any of the hundred-and-one uses to which the timber is applied. For furniture manufacture and wagons for mineral traffic, building materials, dome and roofs of public buildings, cart and wagon bottoms, wheel spokes, railway sprags and many other important purposes where great strength and lasting properties of the wood are points of consideration, oak timber is largely in use. Ash timber is no less useful, especially where strength and suppleness of the wood are qualities in request, and for this reason all kinds of agricultural implements, tool handles, and light furniture are manufactured from this wood. In cutting up a tree certain parts are allocated to certain purposes, the best portions being utilized for the most important.

Profit and Loss of British Strikes

Consul Franklin D. Hale, at Huddersfield, England, has collected strike statistics which will prove of interest. A profit and loss account of the strikes of the last ten years, prepared from government returns, supplemented by details furnished by trade union leaders in the principal industries, show that the loss to the organized workers alone from stoppages of work due to disputes of all kinds in the United Kingdom has been equal to \$84.741.000 in wages, not to speak of a vast sum spent in strike pay. Against this, the net gain in wages resulting from disputes is returned at \$15.209.000, leaving a net loss of \$71.531.000.

In the same period the working classes as a whole have secured advances in wages estimated at over \$72,947,000, but the greater proportion of these advances have been obtained through conciliation, machinery and working agreements. Of every 100 strikes or other disputes recorded in the years under review, 50 per cent have been won by the employers, 25 per cent by the workers, and the remaining 25 per cent have been compromises.

Another Myth Punctured

For some years past there has been a report floating about that the tallest trees in the world are in Australia. Whenever anyone spoke of the extreme tallness of the California redwoods, some one else was almost certain to remark that there were taller trees in Australia, and the statement has usually been accepted as a fact, even by persons very well posted. When bills of particulars have been asked for, two instances have usually been cited showing how tall certain Australian trees are. One was stated to be 464 feet and another 525. The tallest trees were supposed to stand in places so remote that only explorers and adventurers had ever seen them. For that reason there was some doubt concerning their exact location.

The Australians feel commendable pride in their forests, but they wanted a little more exact information concerning the tall timber which was so much talked of. Consequently, at an expense of several hundred dollars they recently sent an engineer into the remote district to locate and measure the trees, particularly the two which had been mentioned so frequently. After much searching he found the two explorers who had found the trees originally, and who knew where they were. He hired the men to take him to the trees. They did so, but it turned out that both took him to the same tree, so it turned out that instead of two, there was only one tree.

Having settled the question as to the identity of the tall timber, the engineer proceeded to measure its exact height, and found that, from the level of the ground to the topmost twig, it was 219 feet and 9 inches. That was a considerable comedown from 525 or even from 464.

Since Australia claims no trees taller than that, it is no longer a competitor with the United States in tall timber. Trees above 219 feet could be numbered in this country by tens of thousands. Such would include the "big trees" of California, the redwoods, Douglas fir, grand fir, noble fir, white fir, sugar pine, and there were formerly white pines in New England that tall. It cannot be stated what is the tallest specimen known in this country. Sargent measured a standing tree 340 feet high, and another is on record which was measured after it fell, and its length was 365 feet.

The Western Cabinet Company of Chicago has changed its name to the $\Lambda {\rm merican}$ Cabinet Company.

B. W. Lord and S. J. Glanton of the Chicago Veneer Company, Danville, Ky_* , spent a couple of days in Chicago last week on business in connection with their recent incorporation under the laws of Kentucky, and increase in capital stock.

J. C. Knox, secretary of the Michigan Hardwood Manufacturers' Association, Cadillac, Mich., stopped off in Chicago for a day last week en route from Washington, where he attended the hearings having to do with the proposed five per cent increase in freight rates. Mr. Knox said the matter has resolved itself into a question as to whether the railroads will get their auditional revenue through the increase or whether they will continue to derive unearned profits from various privileges which they enjoy.

John Weidman, Jr., of Trout Creek, Mich., was in Chicago for several days last week on business.

The Chicago Veneered Door Company of Chicago is a recent bankrupt in this city. The company's liabilities are \$13,873.78 and its assets \$14,407.80

—≺ NEW YORK **>**=

Robert W. Higbie, hardwood manufacturer and wholesaler, is spending a five weeks' vacation in California. Mr. Brownson is in charge of the office end during Mr. Higbie's absence.

Russell J. Perrine of Johnson Brothers, Brooklyn, also president of the New York Lumber Trade Association, is on a trip to Cuba and Palm Beach, Fla. Mr. Perrine always manages to get away from the worst winter weather and certainly did so this time.

Alex Norton, heavy hardwood specialist of Jersey City, reports a good business in that line. He recently made a sale to one of the local railroads that is quite unique; this was a stick 18x18-41 feet. In addition to his heavy oak specializing business he also conducts a public storage road.

David D. La Bau, a retired contractor, died recently at his home in Jersey City. His son, Milton F. La Bau, is in the wholesale lumber business there, making a specialty of cypress.

Word has come from the secretary's office that the Lumber Trade Golf Association will hold its tournament May 26 and 27. The by-laws had to be changed as the month of June is fixed for the time of holding the annual play. The tourney will be held on the links of the Virginia Country Club, Richmond, Va.

New York is in the grip of one of the worst storms in its history and the lumber business is at a standstill. Thirty-six hours of steady snow have filled the streets and made carting impossible except on the most prominent avenues. All outdoor work is tied up and building operations deserted. Retail yards are busy clearing gangways and removing the snow from the yards with no thought of making deliveries. The wholesale market is firm and a good number of orders are being placed for future delivery. The trend of prices is upward but no material advances are noted at this time. Prices, however, have been firm considering all conditions, and no complaint is heard from that score. The spring season is drawing near and greater activity in building is sure to come with it, and a consequent improved condition for hardwoods.

=≺ BUFFALO **>**=

. The chief matter of interest to the hardwood lumbermen during the past month has been the annual convention of the National Wholesale Lumber Dealers' Association. A number of hardwood representatives figured upon the various committees and sub-committees which arranged and looked after the event and there were a good many members of the hardwood trade present at the different business and social sessions held.

H. S. Janes, president of the New Englac d Hardwood Company, spent a few days in the city this month. The res of flactively connected with the American Forest Company, and lately attended a director's meeting.

The Standard Hardwood Lumeer Cor, pure will soon add large quantities of oak, chestnut and other hardwoods to it stods from the south. The company reports trade fair for this time of year.

The Buffalo Hardwood Lumber Company reports business better at present than a year ago. Sales are mostly of oak, with red oak leading. Quartered in firsts and seconds are keeping up well in price.

Jackson & Tindle have been continuing mill operations at Jackson Borough, their new development town in Ontario, Canada, where a large tract of whitewood and other timber is being cut.

R. D. McLean returned early this month from a vacation trip to Cuba, which took him away from this city for a number of weeks. The Hugh Mc-Lean Lumber Company is predicting better prices for quartered oak.

O. E. Yeager states that the hardwood trade is rather quiet, but prospects seem favorable for better business soon. January business in hardwoods was satisfactory.

The National Lumber Company states that business this month compares favorably with last and that there is a pretty fair demand at present for oak and maple flooring.

G. Elias & Bro. have been installing high speed, latest pattern flooring machines. This is about the only concern here now turning out maple flooring for the trade.

T. Sullivan & Co. have lately been getting in a good stock of various hardwoods, including ash, maple and clm, and trade is called fair for this senson.

The A. J. Chestnut Lumber Company reports that it has been cutting quite an amount of maple at one of the mills in Pennsylvania. Mr. Chestnut is pleased to observe that the late severe weather has not shut off the work and the lumber is now ready for shipment.

A. C. Mayer, who went to Vermont to assist in establishing the New England Hardwood Company at Mountain Mills, has resigned to take a responsible position with the Byrd & Matthews Lumber Company, Helen, Ga.

──≺ PHILADELPHIA ≻──

John II. Schofield, of Schofield Brothers, owners of the Saltkatchie Lumber Company, reports business for January and for the first three weeks of February very good, but since that time comparatively quiet. They have had an excellent year's trading and believe business will be brisk once good weather is here. Robert W. and Frank E. Schofield, who have been on a visit to their mill in Schofield, S. C., are taking in the Honaker Lumber Company and other mills in which they are interested.

Hallowell & Souder report very fair trading right along and are optimistic as to outlook. Ralph Souder of this house, who is president of the Philadelphia Wholesale Lumber Dealers' Association, attended the national wholesaler's convention at Buffalo.

Among the recent visitors to the local trade were B. T. Whedon, of W. D. Young & Co., Bay City, Mich., and V. W. Stewart of the Colonial Pine Company, Inc., Wilson, N. C.

W. A. Jackson of the Jackson-Wyatt Lumber Company, says in spite of the recent severe weather the company bagged some very good orders and the outlook is favorable. Mr. Jackson is attending the National Wholesale Lumber Dealers' convention in Buffalo.

As so many of its members are attending the National Wholesale Lumber Dealers' convention in Buffalo, the Lumbermen's Exchange has postponed its monthly meeting from March 5 to March 12, at 1:30 p. m.

James W. Cooper, a retired furniture manufacturer, after a protracted illness, died on February 21. He was eighty-three years old.

=≺ PITTSBURGH ≻=

W. D. Johnston, president of the American Lumber and Manufacturing Company, has returned from a recent trip to the Bermudas and the Panama canal.

J. C. Donges Lumber Company, which was recently incorporated, is getting a nice trade in hardwoods. Mr. Donges has three men on the road.

The Adelman Lumber Company reports some very good business coming, and its three road men are bringing in considerable yard trade, especially from Ohio and Indiany.

The Babcock Lumber Company has been moving some splendid sales of basswood lately. Its stocks in this line are probably as good as any that can be had in the country.

The West Penn Lumber Company reports a very good manufacturing inquiry. J. S. Erving of this company recently made quite a long trip through the Northwest.

The Mutual Lumber Company complains of very bad weather in West Virginia, which has held up shipments considerably. Inquiry from manufacturers, according to H. E. Asht of this company, is not so good as it was last month.

The Aberdeen Lumber Company reports business in gum and cottonwood fairly good. President Woollett complains, however, that prices are being badly cut.

The Kendall lumber plant at Crellin, Md., was practically shut down last week on account of four feet of snow and 24-degrees-below-zero weather.

The Warren Lumber Company of Warren, O., has been incorporated with a capital of \$75,000, to do a general lumber business, by Charles B. Loveless, David Helman, L. L. Jones, H. V. Budish and C. E. Haskell.

Fire of unknown origin destroyed the main portion of the planing mill of Leonhard & Market at Napoleon, O., causing a loss of \$15,000, of which half is covered by insurance.

The Brooklyn Lumber Company of Cleveland has been incorporated with a capital of \$25,000 to do a general lumber business, by D. W. Teachout, J. F. Daliere, E. C. Haag, J. A. Tousdey and L. J. Randall.

The Combination Portable Mantel Company of Delphos, O., has been incorporated with a capital of \$50,000 to do a lumber business, in addition to making and selling portable mantels. The incorporators are Frank E. Smith, Joseph Martin, Edward E. Trusdale, J. K. Allemaier and G. C. Mc-

The Cincinnati Fireproof Door Company of Cincinnati has been incorporated with a capital of \$15,000, to make fireproof doors. The incorporators are C. J. Mees, H. A. Schmiedke, O. F. Steupmfel, F. C. Sidler and F. H. Frecking.

The Tennessee Timber Company recently organized at Cincinnati, O., will open offices in the Second National Bank building early in March. Hall Hagemeyer, vice-president of the Harriman Hardwood Company, is general manager of the new concern.

The Celina Hardwood Manufacturing Company of Celina, O., has purchased a timber tract near Rockford, O., upon which will be erected a sawmill.

The Independent Lumber and Door Company of Cleveland has been incorporated with a capital of \$25,000, to do a general lumber business. The incorporators are Anne L. Taylor, Mrs. Fred E. Thompson, Harry L. Taylor, Wilbert E. Gates and Edward A. Thompson,

Harry E. Fisher, manager of the C. A. Mauk Lumber Company of Toledo, O., died recently, following an operation. He was prominent in Masonic

Arrangements have already been started for the annual convention of the National Association of Builders' Exchanges, which will be held in Columbus in January, 1915. All of the commercial bodies of the Buckeye capital are co-operating in the arrangements.

The W. M. Ritter Lumber Company of Columbus is arranging to erect a three-story office building on a site recently acquired on the southeast corner of Grant avenue and East Broad street.

According to the statement of the city building inspector there were issued 108 permits during the month of February, 1914, with a valuation of more than \$215,000. The falling off from the records of the corresponding month in 1913 was caused by the severe winter weather, which has stopped many building operations.

R. W. Horton, sales manager for the central division of the W. M. Ritter Lumber Company, says trade is as active as could be expected for the time of the year and the volume of business is equal to the corresponding month last year. Buying is being done both by factories and yardmen. The latter, however, are probably the better customers at this time. Implement and vehicle factories are buying hardwood stocks. Dry stocks are not very plentiful.

J. W. Mayhew of the W. M. Ritter Lumber Company, who has been at Battle Creek, Mich., because of ill health, has recovered sufficiently to be at his desk.

J. A. Ford of the Imperial Lumber Company reports a good demand for hardwoods, with prices ruling unchanged.

John R. Gobey of the concern bearing his name reports a good demand for all grades and varieties of hardwoods.

=< INDIANAPOLIS >=====

The Orleans Cabinet Company, Orleans, has issued \$7,500 common and \$10,000 preferred stock.

David Hughes, H. C. Hughes and L. W. Hughes have organized the

Highes Brothers' Company at Bloomington, to conduct a general lumber business. The company has \$50,000 capital

With an authorized capitalization of \$10,000, the Frantz Lumber Company has been organized and incorporated at North Manchester by Ezra Frantz, Lyman Phillips and Lucina Frantz.

Safeblowers made an unsuccessful effort to open the safe of the Jose Kuhn Lumber Company on the night of March 1 and left behind a note complimenting the company on the strength of the safe.

John Ott, eighty-nine years old and the founder of the L. W. Ott Manu facturing Company of this city, died recently. He is survived by four children.

Wood trestles and brackets will be manufactured by the newly organized Pepin's Extensible Trestle and Jack Knife Bracket Company at East Chicago. The company has a \$5,000 capital and is backed by J. C. Pepin. J. N. Pepin and F. R. Schaaf.

Weather conditions during February are held responsible for the large decrease in building operations, 144 permits, with an aggregate valuation of \$257.014 having been issued, as compared with 311 permits, aggregating \$479,653 in February, 1913

With \$300,000 capital the Interstate Automobile Company has been or ganized and incorporated, to operate the old Interstate automobile plant at Muncie, recently purchased from the trustee in bankruptcy.

Interests represented by O. D. Haskett have bought the north plant and yard of the Brannum-Keene Lumber Company at the L. E. & W. railway tracks and Twenty-fifth street, and a modern planing mill is to be erected. The O. D. Haskett Lumber Company has been incorporated with \$5,000 capital. Mr. Haskett formerly was vice president of the Burnet-Lewis Lumber Company.

==**≺** MEMPHIS **≻**=

C. D. Hendrickson, of the C. D. Hendrickson Lumber Company, denies the recently published report that his firm has withdrawn from business in Arkansas and surrendered its charter in that state. He says that, on the contrary, the firm has only recently completed the installation of a circular mill, with capacity of 30,000 feet, at Democrat, Ark., and that, instead of retiring, it is just beginning to operate to good advantage in Arkansas. The headquarters of the company are at Memphis.

Lee Wilson & Co., the Three States Lumber Company, the Chapman-Dewey Lumber Company, the Chicago Mill & Lumber Company, and other lumber firms having timberland holdings in the so-called "sunk lands" of Arkansas will be adversely affected by the recent decision of Judge Trieber of the United States District Court at Little Rock, to the effect that the government has never surrendered title to these lands. decision directly involved only 900 acres but it is pointed out that there are about 120,000 acres that will be affected by this decision which was rendered in the case of Lee Wilson & Co. vs. the United States. It is suggested that the present owners of these lands not only have a title alleged to be imperfect, but that they may find themselves the object of litigation to recover the value of timber removed during the period of their occupancy of the property in question.

The new mill of the Saline River Hardwood Company at Pine Bluff. Ark., has been placed in operation. This company is one of the subsidlaries of the Arkansas Short Leaf Lumber Company, which is in turn owned by the Long-Bell Lumber Company, with headquarters at Kansas City, Mo.

J. T. Willingham, president of the Memphis Coffin Company, and others identified with manufacturing enterprises, including lumber and woodworking industries, are co-operating with the authorities regarding the passage of an employers' liability law that will be satisfactory to all interests concerned. The Lumbermen's Club has already approved the idea of the passage of a measure along this line. The subject, however, is being actively handled by the Memphis Manufacturers' Association as well as the Tennessee Manufacturers' Association, with which the former

The Bellgrade Lumber Company has recently removed its sawmill and logging equipment from Belzoni, Miss., where it has been operated for several years, to Isola, Miss. The firm has cut out all of its timber at the former point and has removed to the latter, as it owns a large tract of timber contiguous to that town. The capacity of the mill has been increased to 50,000 feet in the removal, and the mill is now being operated on full time. It is estimated that it has enough timber in sight to enable it to run for from three to five years. A force of men is still employed at Belzoni to clean up the lumber left on the yards there, but these men will be removed later to Isola. The headquarters of the company are in Memphis, with J. W. McClure in charge of the offices.

Rates on export shipments of lumber from American ports to Hamburg, Germany, have been reduced two cents per hundred pounds recently and exporters here are rather inclined to the view that there will be still other decreases because there is not a large amount of lumber or other tonnage being offered the steamship companies just now. Cotton rates are declining and the belief is entertained that rates on lumber, too, will , work lower. Export lumber business is failing to increase but it is pointed out that financial conditions abroad are improving, and exporters bere regard this as a distinctly favorable development. The worst evil of which exporters here complain is the consigning of lumber which is arriving in considerable quantity abroad and which is seriously affecting

THE GLUE THAT IS APPLIED COLD -

In Flush Veneered Doors

The chief consideration is uniformly highgrade glue. Manufacturers of this modern type of door realize that its development has been retarded because the unavoidable lack of uniformity in other types of glue makes it impossible to know how long a door will stay in condition. The

Of vegetable glue insures absolute uniformity because of the very nature of preparing it and because every pound of our raw material is rigidly inspected.

Vegetable Glue

Is also a rigid and permanent adherent; will not blister in sanding; has no disagreeable odor; will not deteriorate in standing-for a week if necessary; and can be applied cold without any heating application of any kind in the glue room. In addition, the average saving over former glue bills has been twenty per cent where vegetable glue is used.

A DOOR MAKER SAYS:

Tacoma, Washington, U. S. A., Sept. 29, 1918.

Perkins Glue Company,
South Bend, Indiana.

Gentllemen: The convenience and economy of the use of Perkins vegetable glue, its uniformity and the satisfactory results we have obtained, together with the courtesy we have been uniformly shown by the officers and representatives of the company, prompt us to express in this way our appreciation of the Perkins Glue Company and its products.

Yours very truly,

THE WHEELER, OSGOOD COMPANY,

RHC:S R. H. Clarke, Treasurer.

805 J. M. S. Building, South Bend, Indiana

THE GLUE THAT RUNS ABSOLUTELY UNIFORM

bena fide sales at profitable rates. The belief was entertained until a lew months ago that the consignment of lumber abroad was a thing of the past, but there is strong evidences of the recurrence of the practice, much to the chagrin of those whose legitimate business is interfered with by this method of raising money on lumber cargoes. That exporters are looking forward to better conditions, however, finds striking reflection in the manner in which they are operating their mills.

J. W. Bateman has established a mill at McKenzie, Tenn., for the manufacture of hardwood lumber and will also concentrate purchases of hardwoods in that territory at that point, with a view to ultimate distribution

to consuming interests.

The Arkansas Land & Lumber Company at Malvern, Ark., is establishing storage sheds at that point that will have a daily capacity of approximately 10,000,000 feet of lumber. This will enable the company to keep its entire output under cover.

The Chicago Mill & Lumber Company has recently purchased nearly 100,000,000 feet of hardwood timber in Woodruff County, Ark, It is located near Georgetown and the timber is traversed by the Missouri & North Arkansas road, which has one of its termini at Helena, thus furnishing adequate transportation facilities. The purchasing company is building a big sawmill, box factory and veneer plant at Helena and the timber will be worked up therein. The consideration is not known.

---< NASHVILLE >--

The Tennessee Hardwood Lumber Company is getting out some magnificent oak lumber on a tract of 1,400 acres being developed in Wayne county, Kentucky. The company desires to sell the hickory on this tract, said to amount to about 1,000,000 feet, as it does not handle hickory in its

R. S. Maddox of the Pennsylvania State College, appointed to the position of forester of Tennessee some time ago, has announced his acceptance of the position and will at once take up the work of looking after the forest interests of the state.

The recent high tide of the Cumberland river has permitted log operators to begin movement, and several millions of feet of oak, poplar, chestnut and other hardwood logs have been received.

Arthur B. Ransom, president of John B. Ransom & Co., and one of the leading hardwood men of the south, has been elected a member of the board of trustees of Vanderbilt University, succeeding the late Col. Nathaniel Baxter. This honor is gratifying to local lumbermen.

At the recent meeting of the Nashville Lumbermen's Club officers for this year were nominated as follows: Henderson Baker, president; C. E. Hunt, vice-president; Harold Greene, treasurer; Cecil Ewing, secretary; A. B. Ransom, Hamilton Love, P. J. Loevenhart, W. M. Farris, Jr., and Morford Whitson, directors. The nomination is equal to election. Mr. Baker, who will be the new president, has been vice-president, and is senior member of Baker, Jacobs & Co.

Vicegerent Olin White of the Order of Hoo Hoo has issued a call for a concatenation for the middle Tennessee jurisdiction, to be held simultaneously with the annual meeting of the Nashville Lumbermen's Club, March 10, when a large gathering is expected.

The Haskew Lumber Company at South Pittsburg, Tenn., has announced plans to install equipment for the manufacture of all kinds of handles Baker, Jacobs & Co. are developing a tract in Van Buren county, getting

out white oak and poplar and sawing the same near the scene of operations. Local building is not as active as usual at this season. Permits were issued by the city building inspector for improvements to cost \$79,885

during February, compared with \$150,760 the same month last year. The Tennessee Supreme court has handed down a decision of much interest to lumber and other shippers. The Dunlap Lumber Company of Nashville was plaintiff. The Nashville, Chattanooga & St. Louis railway sought to collect demurrage, the payment of which was refused and protested. The railroad has a rule of refusing to deliver shipments on spur tracks, where payment of its charges is not made. The lumber company contested this right, and received a decree for the value of a shipment of lumber which the railroad had refused to deliver and sold for freight charges. The court held that the railroad had no right to refuse to deliver shipments because of the controversy, and that the rule was arbitrary. This means that shippers can contest payment of charges on one shipment without being arbitrarily dealt with as to others.

The Nashville Lumbermen's Club has been greatly gratified to ascertain that a settlement has been made of the case involving milling-in-transit for which it has been fighting for some months. The principle contended for has been sustained by the Interstate Commerce Commission, dealing with the matter of substitution in the handling of logs and lumber in transit. Advice has been received from the freight agent of the Louisville & Nashville railway that the regulation will soon be put into force in accordance with the decision of the commission.

J. W. Bateman will start a wholesale and retail lumber business at Mc-Kenzie, Tenn., and will soon have mills in operation. He also expects to buy the output of plants in that section and concentrate business at McKenzie. Miss Mary Hamilton Love and Otto Delph were married in New York.

The bride is a daughter of John W. Love, a member of Love, Boyd & Co. Announcement is made of the coming marriage of W. M. Farris, Jr., to Miss Mary Haynes of Murfreesboro, Tenn., to be solemnized in April. Mr. Farris is a member of the Patris Hardwood Lun or Company and a promiment young member of the local trade.

Among the Louisville hardwood non-who attended the convention of the National Wholesale Lumor D alers' Association were T. M. Brown, of the W. P. Brown & Sons Lun, or Company, and T. Smith Million, secretary and treasurer of the Churclall Million Linguity Company. The whole salers' association is strong in this part of the country.

New Albany, Louisville's Indiana suburb, is becoming popular with the lumbermen. A few months ago the Edward L. Davis Lumber Company started a branch yard on that side of the river. A short time ago the Stemmelen Lumber Company decided to operate a yard and leased a site in New Albany, removing its office from the Keller building in this city to the new location. The Churchill Milton Lumber Company, recently organized, has followed suit by getting a yard in New Albany. It is still retaining its Louisville office in the Lincoln building, but probably will handle its office work at the yard in the near future.

H. L. Allbaugh, Cincinnati representative of the W. M. Ritter Lumber Company of Columbus, O., was in Louisville recently. He said that February business has showed a considerable improvement over January, and that March is looking still better.

Frederick H. Blum, superintendent of the interior finish plant of the Alfred Struck Company, Louisville, recently died at his home, 1187 East Broadway, Louisville, of pneumonia, following a brief illness. He was sixty-seven years old and had been connected with the company for fifty

The Mechanics and Metals National Bank of New York has filed suit In Louisville against the Swann Day Lumber Company, the Day Lumber & Coal Company and Floyd Day for \$50,000 alleged to be due on a note dated July 9, 1913. The Day Lumber & Coal Company is the successor of the Swann-Day Lumber Company, it is set forth. The note in question, it is stated, was executed by the Swann Day Lumber Company to Floyd Day, and was endorsed and discounted by Mr. Day.

It is reported that the Federal Parquetry Manufacturing Company of New York will start a plant in Lexington, Ky., for the manufacture of parquetry flooring. The plan of operation, it is stated, includes using much of the sawmill waste from central Kentucky bardwood manufacturing plants. I. Herz, representing the company, is now operating a mill in Breathitt county.

Elliston & Franks, Bardwell, Ky., will establish a basket manufacturing plant shortly, having ordered machinery for the manufacture of thin stock, as well as special equipment for manufacturing baskets and boxes

The campaign for a \$300,000 building for the Young Women's Christian Association, which was carried to a successful conclusion in Louisville recently, was helped along by a number of handsome gifts by lumbermen, Col. C. C. Mengel, whose daughter, Mrs. Cuthbert Thompson, was captain of a team in the campaign, gave \$1,500 to the work, while John Churchill, president of the Churchill Milton Lumber Company, contributed \$500. The campaign aroused widespread interest.

The Norman Lumber Company reports that the export trade on gum and ash has been sufficiently good to enable it to continue shipping a large quantity of these woods from its Holly Ridge (La.) mill. E. B. Norman, vice-president of the company, is in charge of sales of the Holly Ridge plant's output.

D. E. Kline, head of the Louisville Vencer Mills, is being talked of in connection with the presidency of the Louisville Commercial Club, one of the leading organizations of business men in the country. Mr. Kline is now vice-president and chairman of the transportation committee of the club, and in that capacity has done splendid work. Owing to the fact that the commercial organization has lawyers, physicians, insurance men and others of that type for executives, few manufacturers having been chosen, Mr. Kline appears to be particularly well fitted for the office.

A good deal of the present condition of business is attributed to the fact that the railroads are not buying. By the same token, much of the complaint regarding poor collections is attributed to the fact that the railroads are not paying for what they have already bought. Many hardwood concerns have accounts eight and ten months old against the carriers.

-----≺ ST. LOUIS ≻=

During February receipts of lumber by rail at St. Louis, as compiled by the Merchants' Exchange, were 14,378 cars. In February last year the receipts were 16,137 cars, showing a loss in February this year of 1,759 cars. Shipments of lumber by rail last February were 11,219 cars. The February shipments were 9,813 cars, a loss of 1,406 cars compared with the corresponding month last year.

Louis H. Lothman, youngest son of William Lothman, president of the Lethman Cypress Company, stole a march on his business associates at the Lothman Cypress Company on Monday afternoon, March 2, and was married to Miss Bertha Lipps. The ceremony took place at the Grace Lutheran church, with only the relatives and immediate friends of both parties present. The happy couple left for the south the same evening and will visit Florida and Cuba before returning home.

W. W. Dings of the Garetson-Greason Lumber Company left Monday night for Kansas City and Denver, and will be gone for about ten days.

Walnut for Export

A lot of splendid assorted American Walnut logs, squared up and ready for export, are shown in the above photograph, which illustrates a section of our exporting yard at Kansas City.

All work, from the selecting of the trees in the woods to the final loading, is done by men trained in our employ and is under our close personal supervision.

Hence we can guarantee satisfaction in both export and domestic shipments.

FRANK PURCELL Kansas City, Mo.

MATHEWS STANDARD Gravity Lumber Conveyer

Made all steel, ball bearing rollers, eight foot sections; easily coupled together and assembled to form line of any required length, over which lumber, flooring, dimension stuff, etc., will travel on a four per cent grade. Adjustable jacks supplied to support conveyer line and secure proper grade. Light, strong and easily portable. Been in successful use for past ten years.

Prices quoted on receipt of information as to lengths and widths of materials, and total distunce to be conveyed. Send rough sketch showing requirement. Ask for catalog.

Seattle, Wash., 1009 White Building

Before leaving he stated that the company's mills were working all right, with the exception of the Wasson mill, which was closed down on account of wet weather. It will start up as soon as the woods become dry enough to get logs.

The C. F. Liebke Hardwood Mill and Lumber Company is working right along sawing logs and shipping them out as fast as sawed. The company has enough orders on hand to take all the lumber it can saw for several weeks, and is getting shipments of logs in almost every day. It has a big shipment of logs coming up by river that is due here in about thirty days.

E. W. Blumer, sales manager of the Lothman Cypress Company, says business is improving and orders are coming in quite well. He expects a big trade as soon as the weather becomes pleasant,

The traffic committee of the Lumbermen's Club sent out a notice to the numbers a few days ago to the effect that an opinion from the Interstate Commerce Commission, No. 4844, in the matter of bills of lading discriminations, respecting loss and damage claims, was banded down. The interpretation of the decision by the committee is that all loss and damage claims presented to the railreads on or before April, 1914, and those claims where damage took place two years prior to February 9, 1914, should, in the opinion of the Interstate Commerce Commission, be adjusted on their merits in order to prevent discriminations that might otherwise result. The commission declined to pass on the reasonableness of the four months clause.

The next business meeting and dinner of the Lumbermen's Club will take place at the City Club Tuesday evening, March 9. W. M. Martin, trust officer of the Mississippi Valley Trust Company, will be the leading speaker, and his topic will be on the regional reserve banking law. He will also answer any questions put to him by the members of the club. The usual dinner will begin at 6:30 sharp. One or two important changes in the bylaws will be acted on at the meeting.

——≺ ARKANSAS ≻——

A new firm, styled Pierce & Little, has recently entered the timber buying field at Pyatt, Ark., and will buy only big white oak logs. The timber which it is buying is to be used in making fine wood veneer for furniture, It has already succeeded in purchasing a large number of logs of the class it wants, and expects to continue operations at Pyatt for some time.

The Pekin Cooperage Company of Pekin, Ill., has recently applied to Francis Keifer, Forest Supervisor of the Ozark National Forest at Harison, Ark., for the purchase of 150,000 feet of white oak timber, to be taken from the Ozark National Forest in Searcy county. The application provides that the timber shall be removed by December 1, 1914, and that at least 25,000 feet of the timber will be cut and paid for by June 30, 1914. The sale will be awarded the highest bidder after thirty days' advertising. The minimum price acceptable for this timber is \$4.00 per thousand.

Cooksey Brothers have recently established a lumber yard and planing mill at Hope at the plant formerly operated by the Southwestern Lumber Company.

The Prescott Stave & Manufacturing Company of Prescott, Ark, has recently purchased 15,000 acres of hardwood timberland, the timber being white oak, red oak, cypress, ash and magnolia, near Dearborn, Tex., and will move its present equipment to that point for operations. The company will in the future operate machinery for the manufacture of tight cooperage stock, and will install a sawmill with a daily capacity of 30,000 feet to work up such material as is not desired for the tight cooperage plant. Railroads will be built from Dearborn to the timberlands to facilitate developments. It is said that there are 20,000,000 feet of white oak timber on the tract.

-----≺ WISCONSIN >---

The John H. Kaiser Lumber Company of Eau Claire will begin operations at its sawmill within a few days. Both the planing mill and the box factory have been run through the winter, and the sawmill has been overhauled and improved to make it ready for a long run. At present 165 men are in the woods getting out logs on contract. When the mill is started the men and horses will be put to work on the company's logs.

Chippewa Falls sustained a serious loss to its industrial progress with the destruction of the plant of the Northwood Furniture Company on February 26. The fire was discovered by a passerby early in the morning and the watchman narrowly escaped in fighting the fire alone. The plant is a total loss, estimated at \$50,000, with eighty per cent blanket irsurance. M. A. Ponanski is president and J. E. Ponanski secretary and treasurer. Office quarters have been secured in the Jenkins Brothers building.

The sawmill and planing mill of the W. H. Rogers Lumber Company at Nashville, Wis., was destroyed by fire; cause unknown. The mill had been running but seventeen days and had a good stock of logs to cut. Two carloads of lumber were also destroyed. The loss is estimated at \$25,000, with about fifty per cent insurance. It is believed that the plant will be rebuilt.

James Pringle, Sr., aged eighty-three, father of Thomas J. Pringle, sectarly and manager of the Milwaukee Casket Company, died March 4 at his home in Stratford, Ont. Mr. and Mrs. T. J. Pringle of Milwaukee were in Stratford at the time of Mr. Pringle's death. He is survived by his widow and three sons. Thomas J. of Milwaukee, Robert and William Pringle of Chicago, and James Pringle of Hamilton, Ont.

The Northwestern Lun, or Compaty is rus by a legal, work in its camps in the Hannibal country. The camps will cut from 55,000,000 to 40,000,000 feet this veat that the cattery of lardwood by the standard product that will keep the big mill at Stanley going all summer and will not necessitate so much sman reloging a war does and year. The company constructed twelve miles of new railroad for summer logging last season and many logs were cut and handed to the mill.

The Johnson Creek Lumber Company has finished its timber cutting in the vicinity of Knowlton and sold the sawmill to the Vetter Manufactur Inc Company of Stevens Point. The Vetter company has purchased up wards of 1,600 acres of timberland and a forty acre mill site in Marathon ceunty on the Little Ean Claire river. The sawmill will be removed to that place, where there are about 10,000,000 feet of hardwood and hem lock. The work of moving will not be completed until fall, so that sawing operations will not be started until heat winter.

With the close of the driving season of 1913-1914, the Menominee River Boom Company of Marinette has completed its forty-sixth year with a record of having handled almost 11,000,0000 feet of timber during that time. The drives on the Menominee will not continue for many more years, but Marinette sawmills will carry on their operations with hard weed brought by rail after the wind-up of river operations.

The Kanacara Lumber & Manufacturing Company will start up in Its new plant at Kaukauna, which replaced the structure destroyed by fire a year ago. The machinery has been removed from the temporary structure and placed in the new mill. The machinery is driven by individual electric motors. The building itself is of modern construction, being made of concrete, steel and brick. Windows are provided on three sides, steam heating is provided throughout the entire structure, automatic dust collectors and an automatic sprinkler system have been installed for fire prote ich.

The sawmill at North Crandon which was purchased by J. A. Walsh from H. L. Roe about a year ago has been sold to Julius Monnette of Fearson, Langlade county. Mr. Monette will remove the mill to a site near Pearson and operate it there. It has a daily capacity of 30,000 feet.

Charles W. Fish of Elcho has made a large cut of timber this season and expects to bring in about 10,000,000 feet of logs. During January, when many loggers were taking their men out of the woods, Mr. Fish kept his entire crew at work with the idea that there would surely be some sleighling this winter. Now that the snow has come he has been hauling his cut and will complete the work shortly.

The Shawano Land & Timber Company is said to be contemplating erecting a sawnill near Rice Lake to work up the timber which it owns in that locality. This winter camps have been established near Crandon and Elcho. The proposed mill near Rice Lake will do away with long hauls of the timber to a sawnill

The Steven & Jarvis Lumber Company of Eau Claire has purchased and is now shipping 500,000 feet of oak, basswood and maple lumber at Richland Center. The lumber will be used in the manufacture of furniture and interior finish. The company has also purchased 3,000,000 feet of standing timber at Ash Ridge, Soldier's Grove, La Farge and Tevera. This timber will be sawed and shipped this year.

The new Lincoln Box Company of Merrill has closed contracts for furnishing the necessary machinery for the new plant. The machinery will be completed about the time the new plant is completed, so that work can be started immediately. J. G. Wenzel is president and George Misterek secretary.

The Kenfield-Lamoreaux Lumber Company has started both day and night operations at the sawmill in Washburn. Boit material has been ceming in at such a rapid rate that it is practically necessary to run the sawmill full time.

Logging contractors of northern Wisconsin are liable to great losses unless snow falls and remains on the ground for another month. The winter's cut is about half completed and the roads are bare, making hauling impossible, according to reports from Cable, Wis. Half of the logs are lying where they are cut and if they are not taken out this winter they will rot. The swamps in which they are lying are inaccessible unless snow covers the ground. This condition is said to be prevailing in nearly all of the fifty camps in the section near Cable.

The Randolph Wagon Works at Randolph recently closed a most successful year. It is one of the big industries of Randolph and affords employment to about forty employes. During the past year the concern shipped 3,800 wagons and paid out about \$25,000 in wages.

Moving pictures of lumbering operations featuring a large steam hauler were taken recently at camp No. 5, near Cornell, Mich., of the I. Stephenson Company of Marinette. It is at this camp that a large steam hauler is used to haul the logs from the woods to the Escanaba & Lake Superior Railroad.

Six heavily loaded sleighs, composing a train which a steam caterpillar log hauler was bauling down hill recently, wrecked the caterpillar of the Holt Lumber Company at its camp fourteen miles northwest of Lakewood. The caterpillar was demolished by an avalanche of logs from the log sleighs attached thereto. The big engine became unmanageable about half way down the hill, causing the logs to break away and crash into the hauler. No one was injured.

The new mechanics' institute of the University of Wisconsin at Madison will be opered this month. Fifteen scholarships, representing twelve trades, will be distributed throughout the state. There will be offered

TROUBLE?

Are you having any lumber trouble?

Does your oak warp, split, check or honeycomb in the kiln?

Does your gum stain, buckle, twist or do the bucking broncho act?

Do you have any difficulty with split panels and defective glue joints?

Do you have to dye, stain or refill your lumber to get a uniform color?

Do you have any reclaims on finished goods from bad glue joints, finish or other reasons?

You can cure all your lumber troubles by using

Kraetzer-cure

You don't have to buy Kraetzer-Cured Lumber—you can produce it yourself from air-dried, half-dry or green stock.

Your lumber will then dry in your kilns quick, straight and free of all defects.

We will tell you where to buy Kraetzer-Cured Lumber, if you ask us.

We will tell you about the Kraetzer Preparator, the use of which insures the quick and accurate seasoning of lumber, if you ask us.

We will send you a new and interesting pamphlet involving the entire theory and practice of steaming wood under pressure, if you ask us.

three courses which will specialize pattern making hadding and from working

A victory for Wissonsin lumbermen dealing in lumber trimmings was gained in a recent decision of the Interstate Commerce Commission, which ruled that railroads shall transport trimmings at fuel rates rather than innour rates. The case was that of the Green Bros. Boy & Lumber Company of Rockford, III., which gets lumber trimmings from Odanah, Wiss, via the Chicago and North Western line, which applied lumber rates. The railroad refused to apply fuel rates, holding that it was made especially low for the sole purpose of allowing farmers to dispose of the products readily after clearing their farms. Other points in Wisconsin which are affected by this ruling are Milwaukee, Eau Claire, Wausau, Stevens Point and Grand Rapids.

The Hardwood Market

—≺ CHICAGO >=

Chicago continues to keep pace with other centers of the country, maintaining a rather quiet tone, mainly because of the absence of good weather tent would tend to open up building operations. As a result the yard and other trades are about marking time, but there is a general report suggesting an opening up of inquiries, which are probably more in the nature of feelers than because of a true desire to buy.

There is not any indication of further breaking in prices, and the indications are that there will not be any more serious offenses in this direction.

The stock situation at consumers' yards is favorable to the future of the business generally, as there is nowhere any sufficient supply to last for any length of time. However, buying continues to be on a good basis for immediate consumption. This, however, is probably almost as much on account of a refusal of strong concerns to contract for large orders for future delivery as it is because of any general policy on the part of the buyers in this direction. An indication of this condition is seen in concetion with a large veneer concern which constantly carries in stock a large quantity of veneers ready for immediate shipment. The veneer business has not been any too good for some time back, but at present is doing the best business probably for a good while, based mainly on orders for immediate delivery. It can deliver these orders because of stock on hands and is receiving them because of the knowledge of this condition on the part of the buying trade.

The general building situation is in pretty fair standing and the indications are that it will open up in first-class order as the weather becomes more satisfactory. There is nothing big looked for from the consuming factories, but this branch of the consuming trade will probably take its quota before the spring is very far advanced. On the whole the Chicago situation, while not at present any too satisfactory, bids well for the future, and this favorable future is not very far ahead.

=≺ BUFFALO >=

The hardwood market shows up fairly well for the season, though whole-salers report a smaller movement as a rule than that of January, which was quite a good month. Conditions at present seem to point toward early improvement. Dealers are hopeful after interviewing their customers, and it looks as though this month would see quite a fair number of orders placed and at prices which will show considerable firmness.

Lately there has been some cutting of plain oak prices in this territory, although most members of the trade have not yielded to the tendency to take such action. It is not producing much more business and has the usual tendency to spoil the market for everybody concerned. Maple has been holding up about as well as any hardwood and is being bought for flooring uses to a good extent. Ash, elm and chestnut are having a fair sale. The weather has not been mild enough to allow building operations to be carried out to any extent, and this has had some restraining influence-upon business.

—≺ PHILADELPHIA ≻=

The recent heavy snowstorms have to some extent interfered with a fluent hardwood lumber traffic, but on the return of good weather a resumption of the noticeably improved conditions may be expected. Underiably the greatest drawback to an early prosperity is the dilatory decision of the Interstate Commerce Commission as to the five per cent increase in freight rates requested by the railroads. It is the general opinion that the increase will eventually be granted, but it is regretted that this action was taken by the commission, as it is believed that had it given some favorable endorsement of the railroads' request the latter would have come into the market at once for a large block of material. The general tone of the hardwood lumber buyers is optimistic and a tendency prevails to protect themselves by closing deals for future delivery. Inquiries have been multiplying of late which indicate that buyers are feeling the market for early purchases. Prices have shown very little change. Quartered oak, although not increasing in volume of sales, holds firm; oak not so strong; maple, ash, chestnut and birch steady; beech a little livelier. Low grades scarce and in good demand.

—≺ PITTSBURGH ≻=

Cold weather and deep snows have put the lunder business quite a little to the bad the past two weeks. And it that has seen dow for the reason that all outside operations it were tool. Yeard men leaded up in January with enough lumber to carry them through the winter and they are now waiting for sunshine to develop new building prospects. The building situation is greatly improved. There is little doubt but that trade in this line will be good this summer unless labor difficulties hinder. Inquiries from furniture, automobile and implement concerns are fairly good, but these manufacturers do not seem to be ordering stock for more than three months abade. Railroad business is very quiet. Little is expected in this line before the Interstate Commore. Committee in some decision on freight rates is handed down.

=----≺ BALTIMORE >=

The hardwood trade of this section continues quiet, with the demand very moderate and prices in the main easy. The falling off in the movement noted last month is still in evidence and for the present the indications do not encourage expectations that a marked expansion in the requirements will take place before long. At the same time it is to be said that the mills are also hampered in their work, the production being decidedly curtailed by reason of cold weather and deep snow. While Baltimore got off luckier than some of the other sections, the actual need for lumber has been restricted to an appreciable extent and this has helped to emphasize the quiet. As for the northern sections, business there has come to a complete standstill, and perhaps weeks will elapse before traffic becomes entirely normal again. Work of all kinds in which hardwoods are used has been interfered with, so that the curtailment of production is not likely to have the effect it might exert if the sources of distribution had remained open. shutdown at the mills for an indefinite period also seems inevitable, and it is therefore to be said that at least no further additions to the supplies will be made, with the probable result of causing congestion.

The common grades of such woods as oak, poplar and chestnut are relatively low in price, the offerings having been far larger than regard for firm values would have made desirable. Most yards appear to have very adequate stocks on hand, and they are showing no eagerness to add to their holdings. In many instances, as a matter of fact, there is a positive refusal to entertain offers by salesmen. On the other hand, it is to be said that no inherent weakness seems to affect the trade. In spite of the evident besitancy and the check upon the movement, the foundations of the business are seemingly firm, the holding back being due chiefly to a feeling of uncertainty as to political developments. The better grades of lumber are neither in excessive supply nor are they being unduly pushed, and the quotations on them are fairly steady. The export trade reflects the unsatisfactory general conditions that prevail abroad, and liberal shipments have kept supplies so large as to give the buyers in effect control of the market. Some of the shippers here say that their export business has been reduced to about one-third of what it was last year, and if this policy is generally pursued it should not be very long before an appreciable improvement takes place. For the present consignment shipping is to be strongly advised against as inviting serious losses; in fact, caution and conservatism are to be enjoined all along the line.

——≺ COLUMBUS ≻—

The hardwood trade in Columbus and central Ohio territory has been ruling steady during the past fortnight. There is a good demand for stocks from both yardmen and purchasing agents of factories, and the volume of business is all that could be expected for the season. The extreme cold weather which prevailed in the latter part of February and early in March had the effect of making the market quiet. It stopped building operations and made dealers slow in placing orders.

One of the best features of the trade is the buying on the part of factories. Implement and vehicle concerns are buying steadily and they are pretty busy. Furniture concerns are expected to be in the market soon, and buying on the part of automobile factories is also auticipated. Factory stocks are generally light. Stocks in the hands of dealers are not very large, but they are gradually accumulating, to be prepared for the rush in the spring. The indications are very bright for active building as soon as the weather breaks. Architects and contractors are busy figuring on plans. It is estimated that there will be about \$8,000,000 in new structures erected in Columbus during the coming year.

Shipments have been delayed to a certain extent by the wintry weather, but this condition is expected to be only temporary. Dry stocks in the hands of mill owners are not large. The feeling in hardwood circles is generally good and collections show an improvement.

Quartered and plain oak are both firm and the volume of business is foir. There is a good demand for chestnut, especially sound wormy, which is exceptionally strong. Poplar is also moving well and stocks are not as large as formerly. Basswood and ash are strong and the entire list is nolding up well.

——≺ CINCINNATI >——

The general market conditions are quiet, to say the least, just at this time, so far as real business is concerned, but judging from the quantities

We offer the following stock of our own production, from good logs. Consists of good widths and lengths. Is band sawn and carefully edged and trimmed.

of inquiries length equilibrium (i.e., $a(t) = a(\rho)(t)$) are very that thing for a nice steady torsiness when the weat a(t) = tt is . It is said that factories are trying to get busy and wild seek at seek roomitter, and the run down condition of stock will have to be built up. This is said to account for the steady inquiry for hardwoods covering nearly every item on the list, which are looked upon as feelers, and there is bound to result a general buying disposition by early spring, and earlier this year than usual. It is expected that the buying will be moderate and conservative, growing stronger as the business in the manufactured article increases There is a good tone to the oak market in all grades, and this wood is moving fairly well. Quartered oak is said to be improving also. Red gum in high grades is dull, while sap gum in upper grades is in much bet ter request. There has been quite a little improvement in the movement of common and better chestnut and dealers find this an encouraging fea ture. Ash, as has been the case for many weeks, is the best seller on the hardwood list. Maple is in active demand. All low grades of hardwoods suitable for the box manufacturers are in excellent demand at sat Isfactory prices. Prices on all hardwoods are yery firm and manufacturers claim to be well supplied with orders and are not loading up too heavily with future business at present prices. This indicates further strength later on and is based upon the expected good demand coupled with known light stocks in the hands of consumers

===-≺ INDIANAPOLIS ≻=

There has been considerable inactivity in the bardwood market during the last two weeks, due largely to the heavy snowstorms throughout the state. Traffic has been interrupted to a large extent and inbound and outbound shipments have been delayed. While hardwood concerns are receiving many inquiries, indicating a good business later on, there has not been much buying. Conditions, however, are approximately as good as they were at this time last year. Prices are rather steady, considering conditions. The furniture and automobile industries, which use much hardwood, are reporting a steady improvement. There is also a vast amount of building, requiring interior bardwood trim, in sight.

=-< NASHVILLE >----

Cold weather has had the effect of checking the improvement that was noted in the hardwood market during the first half of Pebruary, though manufacturers and shippers report a fair demand. Plain and quartered oak is the leading seller, with some demand noted for poplar and ash. While conditions would warrant an easier tone in the market, most of the lumber is in strong hands, and little disposition is manifested to reduce prices. It is insisted that the raw material continues high, and that hardwood lumber is good property.

----≺ LOUISVILLE >=

Business is looking a good deal better now than it has since the first of the year. The upward trend of prices on one or two woods, and the fact that a scarcity of stock in certain items is being experienced, with the demand relatively light, suggests what may be expected if business picks up to anything like the proportions which may logically be expected. There seems to be a surplusage of good plain oak at present, but remembering the shortage of this wood a year ago, and recalling the fact that oak, while not impervious to substitution, holds its own against other woods better than most, it seems reasonable to believe that the volume of business will soon be sufficiently good to move whatever oversupply may now be in evidence. Certainly plain oak may be had at present at prices which make it a very good buy, seeming to suggest that consumers who really want oak must find the game of substitution rather unprofitable. Quartered oak is in good demand. Quartered red, of course, is in small supply, and the demand for it, though not as large as for quartered white, can hardly be supplied. Prices generally are holding firm. Chestnut is moving exceptionally well just now, some advances in prices having been noted. A good many of the larger mills are reported to be oversold on lowgrade chestnut, including sound wormy, and this, of course, is stimulating the demand. It seems likely that other woods will shortly undergo similar treatment, and that a general stiffening up all along the line will be in order. While business has not expanded to large proportions as yet. general conditions are so good that everybody is feeling cheerful over the

The hardwood situation continues to improve, and nearly all the items on the list are in fair request. Orders are coming in much better than they did and call for a better volume. Most of the orders received ask for quick delivery. Plain sawed white oak seems to be in best demand, with wide poplar and ash coming next. The other items are only in moderate request. There is also a noticeable improvement in the call for red gum. It is the consensus of opinion that just as soon as the very severe weather that has been prevailing for the past couple of weeks is over and the weather becomes settled and allows of building operations to go on, the hardwood situation will become stronger. It is also thought that prices will become stronger. The cypress demand is showing improvement, and orders are coming in much better than they did and for larger amounts.

Mahogany and Circassian Lumber & Veneers

¶ The largest assortment of finest figured Mahogany Logs, Lumber and Veneers in the country can be found at the Chicago plant of C. L. Willey.

¶ We are just in receipt of fifteen cars of remarkably superior Circassian Walnut Logs, large size, well-figured and of good color, which are now being cut into Veneers.

¶ A visit or correspondence from discriminating buyers of all varieties of fine Imported and Domestic Cabinet Woods in Lumber and Veneer is solicited.

¶ You will not only find the Willey warehouses well stocked with a superb collection of Circassian, Mahogany, Vermilion, Black Walnut and other fancy foreign and domestic lumber and veneers, but buyers are assured of prompt and painstaking service, and a quality of product not usually obtainable.

¶ To visit the plant take Blue Island Ave. car at the postoffice to Robey Street.

The distributors of this lumber are feeling much encouraged over the outlook, as it is nearly time for big consumers of lumber to come into the market with their orders. This also applies to the retailer. There is no doubt that the distributors in this center will get plenty of business when the weather conditions improve. As the stocks here are in pretty good shape, there is a feeling of optimism prevailing all along the line

=≺ MILWAUKEE ≻=

The increased activity in the logging country of northern Wisconsin and Michigan has resulted in a much better feeling in the hardwood trade. While it is pretty well understood at this time that the log output will not be so large as would have been the case had winter weather made its appearance before February, yet the present favorable weather conditions in the northern country are allowing loggers and lumbermen to rush their work with a vim. No difficulty is being experienced in getting the accumulated logs to the sidings for shipment and many concerns which have not closed their logging camps are sending their sawyers back to Several of the largest concerns in northern Wisconsin have their camp forces at work and will keep them cutting until the spring break-up. Logs are arriving at all the mills and many plants are being placed in operation.

Despite the feeling that the log output will be larger than was anticipated a few weeks ago, lumbermen are of the opinion that a genuine shortage of dry hardwood stocks will be experienced before the rush of the spring building season is over with. Stocks of northern woods, particularly birch and maple, are unusually low, even at this early date. Basswood stocks, especially in the lower grade stuff, are being reduced as a result of the increased activity of the box manufacturers. Offerings of southern hardwood are somewhat in excess of demand just at the present time. although this situation is believed to be only temporary. The demand for both plain and quarter-sawed oak is showing considerable improvement, while a better trade may be expected with the advance of the building season.

The leading factory consumers of hardwood are not in the market just at the present time, although most of them are making inquiries, regarded as a favorable sign. Stocks in the hands of the factory trade are light and it is only a matter of time when these people will have to come into the market. The fear of much higher prices will also be a factor in bringing about early buying.

Dealers about the state and in other territory tributary to Milwaukee are placing some fairly good orders. Wholesalers have been endeavoring to impress upon retailers the fact that now is the time to get in their orders for spring stock while shipping facilities are favorable and before hardwood prices make further advances. Salesmen say that stocks in most retail yards are far from large.

The building activity in Milwaukee is being well maintained and there have been steady, consistent gains since the first of the year. During the month of February there were 127 permits issued by Building Inspector W. D. Harper for structures to cost \$578,382, while during the corresponding month a year ago there were 119 permits granted, representing an investment of \$518,836. During the last week of the month there were 35 permits issued for buildings to cost \$285,280, as compared with an investment of only \$147,700 during the same week a year ago.

---≺LIVERPOOL≻=

Business in Liverpool and vicinity has been exceedingly quiet and prices ruling have been far from satisfactory. The trade is still suffering from a surfeit of consignment deliveries. Prices ruling are very peculiar and very little reliance can be placed on the figures heard. Stocks, on the other hand, are rather smaller than were noticeable in our last report, but in some lines things are in a very bad state. For example, there are over 1,000 logs of round bickory in first hands still unsold, and this in the face of very heavy shipments coming forward by every ship. Naturally, in face of this, buyers here are not inclined to purchase beyond their immediate requirements. Three mahogany sales have been held recently and as was expected, in view of the heavy stocks, poor prices only were realized. Lumbermen state that they cannot indeed see any immediate chance that this situation will be relieved; in fact, they see still lower prices coming. Round ash logs are coming in freely and have on the whole been placed satisfactorily, as the stock is not very heavy. Ash planks, on the other hand, are exceedingly weak and some ridiculous prices have been named recently. Some consignment parcels in weak hands have changed hands at prices about half their proper values. Shippers should on no account send any consignment parcels of ash to this market, as shipments would be very unprofitable. There is no chance of contracts being made on a profitable basis for some months to come, as stocks are very heavy and consumers are not very busy. The oak market is somewhat better, and some good movements have been made. Cabinet stocks have recovered to some extent from the heavy consignments noted a few months ago, while wagon stocks have moved quietly into consumption. There are, however, large parcels of oak planks still unsold; this is true chiefly of stock of an inferior quality. Round oak logs are weak and there is no sale at the moment. Birch is good and in view of the small stocks good values should be realized for the new shipments. Poplar values in all grades are decidedly weak, while quartered oak is scarce and firm. Cottonwood is slightly better, as is also gum lumber in wide specifications.

We are prepared to prove to you-by actual test-that you are losing money by not using

Atkins Inserted Tooth Saws

The quality of material used in ATKINS INSERTED TOOTH BLADES means a decreased expense for refitting. The steel, construction and methods used in the manufacture of ATKINS BITS and HOLDERS insure the best results.

These are broad statements, but we are perfectly willing to prove them by actual comparative tests.

The blades are made of the same SILVER STEEL as used in ATKINS SOLID TOOTH SAWS—insuring maximum wear and tension holding qualities.

The Teeth and Holders are made of a special alloy steel of great tensile strength. They are drop forged and finished by hand—absolutely uniform.

The teeth have the correct hook-take less power.

The holders and teeth are constructed on the same circle—with uniform strain.

The Holders will carry the sawdust out perfectly. The teeth are given a correct swage—insuring uniform clearance.

The Tempering is done in special furnaces and methods used which produce as fine a temper as clock spring.

The accurate finishing of all parts give each tooth the max-

The accurate finishing of all parts give each tooth the maximum cutting capacity.

The adjustment of the tooth into the holder is scientific, producing the best and most economical results.

The secret of the successful use of Saws lies primarily in the feature of sharp and accurately shaped teeth, and secondly thru a proper tension. These features are exemplified in ATKINS SILVER STEEL INSERTED TOOTH SAWS.

HOW TO GET THEM

You may easily secure a Genuine ATKINS SILVER STEEL SAW from any supply house by simply specifying "ATKINS." Atkins Bits and Holders are interchangeable with other blades, but to secure the best results, you should use the SILVER STEEL BLADE. If you have any difficulty in getting proper service from your usual source of supply, write to the nearest address below

E. C. ATKINS & CO., Inc.

VENEERS AND PANELS

Ahnapee Veneer & Seating Co.

HOME OFFICE, FACTORY AND VENEER MILL, ALGOMA, WIS.

VENEER AND SAWMILL, BIRCHWOOD, WIS.

We manufacture at our Birchwood plant single ply veneers of all native northern woods and deliver stock that is in shape to glue.

From our Algoma factory, where we have specialized for twenty years, we produce panels of all sizes, flat or bent to shape, in all woods, notably in Mahogany and Quarter-Sawed Oak.

We make no two-ply stock, and do not employ sliced cut quartered oak. Our quartered oak panels are all from sawed veneer. Every pound of glue we use is guaranteed hide stock. We do not use retainers. Our gluing forms are put under powerful screws and left until the glue has thoroughly set.

If you seek a guaranteed product that is the best, based on results accomplished by most painstaking attention and study of every detail, combined with the use of the best stock and an up-to-date equipment, our product will appeal to you.

If you are a "price buyer" we probably cannot interest you.

Custom Mill Work, Storage, Inspection

ON

Foreign Fancy Woods, Mahogany, Cedar, Circassian

We receive the logs, store or warehouse them, manufacture them into lumber, cut or saw veneers, pile and store the product, and ship via any railroad. Also furnish inspection returns on logs or lumber. Can furnish accommodations and economies which it is impossible to secure elsewhere. We always have on our yards parcels of plain and figured African, Mexican and Cuban Mahogany, Circassian Walnut and Cedar logs, placed here for sale by direct foreign shippers, from which advantageous purchases can be made.

The Right Lumber at the Right Price

If you are in the market for hardwoods, look over this list of stock and pick out what you want. Inquiries of the firms listing it will show you that the material is properly priced, and that it will be an unusually good buy at the figures quoted. In case you can use a mixed car, made up of several items offered by various houses, ask for a joint quotation. Your attention is particularly called to the wide assortment of stock offered. Small users can have their entire wants taken care of here, quantities available being as large or as small as desired.

OUR DOUBLE BAND MILL-HUTTIG, ARK,

Why We Can Give "Value Received"

We own one hundred thousand acres of the best virgin

We operate large band mills at Huttig, Ark., and Deering, Mo.

We cut FORTY MILLION feet of hardwoods annually and carry 15,000,000 feet IN STOCK.

We sell only stock cut on our own mills and so can GUAR-ANTEE the quality of EVERY shipment.

We ship high grades that increase the size and percentage of your cuttings, reduce factory costs and shrink the waste pile. Therefore:

We can SAVE YOU MONEY on every shipment of oak, ash, gum, elm, cypress, tupelo, hickory, cottonwood, sycamore, soft maple and dimension.

LET US PROVE THIS ON YOUR NEXT ORDER

Wisconsin Lumber Company Harvester Bldg. CHICAGO

A floor to adore

For thirty-three years Wilce's Hardwood Flooring has been among the foremost on the market and because it stands today "inequaled" is the best evidence that its manufacturer has kept abreast of modern methods and the advanced demands of the trade. To convince yourself of the above statements, try our polished surface flooring, tongued and grooved, hollow backed, with matched ends and holes for blind nalling—youl find it reduces the expense of laying and polishing.

Our Booklet tells all about Hardwood Flooring and how to care for it—also prices—and is free

The T. Wilce Company

22nd and Throop Sta. CHICAGO, ILL.

CHOICE BIRCH AND MAPLE—10,500 ACRES

I offer the above tract of best quality and splendidly located timber in Ontario, ten miles from Sault Ste. Marie, Ontario, a town of 25,000 population. Will cut 90% birch and maple. Estimated by George F. Beardsley, cruiser of Grand Rapids, Mich. Location and mill site on deep water. Can ship either by water or rail. Lands in fee simple—no crown dues, no export restrictions. Close to American Soo. Easy logging. Reasonable price and terms.

William H. Ranson, Sault Ste Marie, Mich.

SAVE YOUR MONEY BY USING THE

RED BOOK Published Semi-annually in February and August

It contains a carefully prepared list of the buyers of lumber in car lots, both among the dealers and manufacturers. The book indicates their financial standing and manner of meeting obligations. Covers the United States, Alberta, Manitoba and Saskatchewan. The trade recognizes this book as the authority on the line it covers.

A well organized Collection Department is also operated and the same is open to you. Write for terms.

What Veneer and Panel Consumers Will Use in 1914

This information is shown completely in our new correction pamphlet (off the press this week), which revises our veneer and panel consumers' requirements lists complete according to 1914 requirements. The information contained is all first hand and guaranteed to be authentic. It gives all details that you want to know on which to base an intelligent quotation.

It would cost you thousands of dollars and years of work to compile the same information—we know because that is what it cost us. You can have it for 1% of its real cost.

As its best use is while it is fresh and it costs only two cents to write, drop us a line today and let us give you the details.

BLACK WALNUT

The Aristocrat of American Hardwoods. Manufacturers of furniture, pianos and interior finish know that Black Walnut is the finest hardwood produced on this continent. They may have been under the impression heretofore that it is not possible to get a sufficient continuous supply of this wood to enable them to use it. The purpose of this and succeeding advertisements is to show that there is an ample and permanent supply, and that those who specify it will be able to get it now and hereafter.

The stock listed below is dry and ready to ship, and the firms indicated will be glad to quote anyone interested in logs, lumber or veneers, and also to give full information about the stock.

Review and Outlook

General Market Conditions

COUNTRY-WIDE RUSH of inquiries for all kinds of hard woods has been apparent during the last two or three weeks. This is true in all centers and seems to apply to all grades and kinds of hardwood lumber. As a consequence, the lumbermen throughout the country have been puzzled to decide whether or not the inquiries are an indication of the immediate return of active business, or whether as a general thing it was simply a question of feeling about by the buyers as to the possibilities of a further break in the market. In either event, there seems to be but one logical course for the wise lumberman to pursue. If the inquiries are as a general thing bona fide, it is of course needless to say that prices will hold up firmly, and will attain even a more favorable level, but if the majority of inquiries are shown to be merely feelers, which it seems they are, it is entirely up to the lumberman to provide his own salvation by adhering to a fair level of prices in all markets.

In other words, if with this influx of inquiries there is shown a tendency to break in order to place orders on the books, the result will be a still further drag on the part of the buying trade, and a continued hesitancy in the placing of any kind of favorable business. On the other hand, if a strong front is shown and producers and wholesalers generally show that they have confidence in the future of hardwood stocks as good property, the result will be that the buying trade will realize that the uncertain situation is about over and will gradually return to normal buying conditions.

This condition is rather proven by the attitude of large consuming concerns whose yards contain millions and in some cases as much as 100,000,000 feet of dry hardwood stocks. These people, of course, are in position to run some little time without purchases, and in fact they are the ones who are strongest in their continuance of the policy of retrenchment as far as lumber purchases are concerned. It is very evident that the concern which uses millions of feet of lumber in a year in the production of its articles is bound to be as a matter of business policy a bear on the market. Hence any evident policy which they assume towards producers can be presumed to be instigated by some such motive. These classes of concerns have been, as stated, the most consistent non-buyers and give evidence that their policy is the result of a belief in their ability to "bear" the hardwood market and to secure stocks at more favorable prices than they can now be purchased at. It is obvious then that this attitude is the result of a belief that the lumbermen will prove themselves strong enough to continue to hold for fair values. It is not the result of lack of business on the part of these concerns, as practically without exception they are recording themselves as being in most excellent condition as far as prospects for sales are concerned. Hence, it behooves the hardwood trade to maintain as firm a front as possible in the face of such conditions.

The extremely unsatisfactory condition of the export trade from all ports of the country, as far as hardwoods are concerned particularly, is unquestionably having its effect on domestic conditions. For instance, the communications from the port of Baltimore indicate that in February of this year in some items there was about only one-half as much lumber shipped as in February of 1913. The result of this is that a great deal of stock which would have gone to the foreign markets is this year diverted to domestic consumers. This simply means that there is a greater quantity of stock to be taken up locally than last year.

It is not to be wondered at, then, that prices are not so firm as they were at that time. Still there is a deplorable tendency on the part of a great many lumbermen to continue in a pessimistic mood, resulting from a comparison of prices of this year with those of last. There does not seem to have been a proper realization of the abnormal conditions which effected the extremely high prices in some items of hardwood which prevailed a year ago. As a general thing the price level which is being maintained at the present time is entirely fair, considering the general conditions.

The effect which inclement weather conditions have on the general hardwood market is clearly shown by the varying reports which come from different centers of the country at this time, some sections being overwhelmed with snow and wintry weather while others are enjoying spring-like conditions. In the first class the reports continue to be rather optimistic and are couched in terms of hope for the future. In the other reports the opening up of spring weather has resulted in more active inquiry and more active buying and movement of stocks, which is not only the result of renewed activities, but comes from a more cheerful frame of mind resulting from the more agreeable weather. This, while a psychological factor, is one that should not be entirely overlooked.

It appears that, to use the expression of the sales manager of a large southern concern, we are "on the brink of the crater of a volcano of business." The underlying and internal conditions which would tend toward a re-opening of entirely normal buying conditions as far as lumber is concerned, are most excellent. These conditions have been apparent for some little time and continued favorable comment as to the aspect of their business as given by the buyers themselves, gives increasing reason for logical hope for the future. It appears, however, that there is something unusual behind the present slowness, and, as stated before, this can probably be attributed to a large extent to the fact that one buyer is waiting for the other. If a few of the large concerns who are in a position to place big orders should go into the market, the rest would follow,

without a question of doubt. The trouble is not with the buyers of these concerns themselves, but it seems that in most cases orders have come from headquarters of the big consumers to keep out of the buying field entirely, and this policy will be continued until counterorders have been issued.

Judging from the extremely favorable condition of their trade, it would seem that these concerns must soon go actively into the purchasing game.

This condition is clearly shown by the experience which was related by a southern hardwood man on a northern trip. It seems that his concern had had a large order for oak cancelled by a furniture house. The man in question called on these people, who finally told him to come around within a couple of days after they had had a chance to size up the situation, as they had already placed the order with another concern at \$2 less than his price. He went back as told and was gratified to learn that they had decided to take on his stock at his figure as they had found they could take care of it.

This simply indicates that the buyers in a good many cases do not realize exactly what they are in a position to do. They have so gotten into the habit of conservative buying of the hand-to-mouth nature that it is difficult to get out of the rut.

As to the various woods: Oak seems to be picking up somewhat in prices all along the line. There seems to be some little difficulty in getting red gum back to a desirable position, as a great many factories have gone over to the use of sap gum instead.

Of the northern woods, birch and maple are continuing to show gratifying activity. Poplar is not particularly active, although the lower grades are moving in excellent shape as are basswood, cottonwood and the lower grades of gum.

The veneer business continues to be rather slack, but this is simply due to the condition that affects the lumber business as well.

In summing up the situation, it is entirely logical to believe that the present calendar year will as a whole round out as a very good one. It should not be expected, however, that anything of a particularly gratifying nature will come into evidence until the last half, as it will undoubtedly take six or eight months for the country to thoroughly adjust itself to the radically changing and changed conditions.

The Cover Picture

THE PICTURE WHICH ILLUSTRATES THE COVER of this issue of Hardwood Record was made on the coast of South Carolina, and the tree forming the principal feature is the well-known southern evergreen oak (Quercus virginiana). Its limbs are festooned with Spanish moss, which is one of the most common sights in forests near the coast in the southern states.

The picture may appeal more to musicians and literary people than to lumbermen, though there is no reason why a lumberman may not like both music and poetry as a rest and recreation when the rush hours of business are over. To such the tree featured on the front cover will appeal.

Under this tree Sydney Lanier wrote "The Marshes of Glynn," which some critics consider to be one of the most finished pieces of literature in the English language, though others would not give it such high praise.

The poem has a pathetic history. The author wrote it while dying, and he has been compared to the swan "which dying, dies in melody."

The biography of Sydney Lanier is short and simple. He was born at Macon, Ga., in 1842, entered the Confederate army, was taken prisoner, and exposure brought on tuberculosis, against which he fought heroically but to which he finally succumbed. He went to Baltimore, where he earned a precarious livelihood as a musician. He sent verses to the magazines and they all came back rejected until one by chance reached the public. Critics detected the work of a genius, and his reputation as a poet quickly followed. Johns Hopkins University gave him a chair in literature, and for the first time in his life he could feel that the means of a livelihood were assured; but it came too late to do him much good.

He went to the mountains of North Carolina as a last hope

of regaining his health, but without avail. His last literary work was the writing of a collection of poems, "Hymns of the Marshes," of which "The Marshes of Glynn" is one. It was completed while he was still able to walk, but some of his other poems were composed after he had become too weak to lift his head from his pillow.

The marsh, which was before his eyes and which was minutely described in the verses, appears in the picture, stretching away toward the sea on the horizon. A single verse will suffice to show the tone and measure of the poem:

"Oh, what is abroad in the marsh and the terminal sea?

Somehow my soul seems suddenly free

From the weighing of fate and the sad discussion of sin

By the length and the breadth and the sweep of the Marshes
of Glynn."

The photograph from which the cover picture was made is from the collection of the Field Museum, Chicago. The tree's trunk is somewhat different from that of the live oak as it is usually met with, in that it divides so near the ground. This oak generally has a short, single trunk. The moss on the branches is not a true moss, but is a species of pineapple which has acquired arboreal habits. It is a most interesting plant and has no true roots. Its sustenance comes almost wholly from the air. It hangs on the limbs of trees for support, but does not draw much, if any, substance from them, and therefore is not a parasite, as mistletoe is, or a saprophyte, like fungus. This plant (Dendropogon usenoides) is commonly called Spanish moss. It has leaves longer and narrower than those of any grass. It has blooms so small and inconspicuous that people who have been intimately acquainted with the plant all their lives declare that it has no flowers. Its fruit likewise escapes notice, but the seeds are somewhat conspicuous. They are attached to down like seeds of the dandelion, and they float long distances through the air and lodge against the trunks and branches of trees where, after securely attaching themselves, they germinate.

The plant may propagate itself without seeds. Sections torn from the parent plant are carried by wind until they lodge on a limb or against a trunk. They quickly throw out tendrils which fasten on the bark, and the sprig begins to grow. Many trees become so completely covered with this co-called moss that they are smothered to death, or the great weight breaks them down. This moss has been gathered for one hundred and fifty years in the South and has been used to stuff mattresses, upholster chairs, fill horse collars, and for other purposes. When cured, which process consists in removing all the leaves and outer bark, the commercial article looks like black horsehair, and much of it is bought and sold as such. It is shipped to all civilized countries of the world. New Orleans is the center of the business.

The festoons hanging from the branches of trees range in length from one to ten feet, and in rare instances they are fifteen or even twenty feet long. The longest strands shown in the picture are probably four or five feet. Long strands are not found on trees which are subjected to the full sweep of the wind, but in deep swamps where trees stand close together.

Consignments Still in Evidence

WHY A MAN SHOULD SELL HIS STOCK at about one-half of what it is actually worth, even though he is in imminent need of funds, is difficult to understand, but this condition actually prevails abroad in a good many cases. A slackening up in demand for lumber products always brings with it a large amount of consignment shipments for consumers abroad. Small mills, which have no adequate financial backing and which cannot afford to hold their stock and must have actual funds, cannot wait for the slow process of selling their stocks at adequate prices in the home market or abroad in the usual channels, and utilize this means of replenishing their exchequers in an expeditious manner regardless of the ultimate cost.

Instances are actually on record during the past financial stress, of sales which have actually been made abroad of consignment shipments of American hardwoods, which sold at prices just about one-

half below what should have been considered prevailing market values. The result on the general market, of course, is too apparent to need any detailed explanation, but it would seem that the resulting effect upon the shipper himself would be too appalling to make it possible for him to continue to do business in that manner. Yet reports are abroad telling of constantly repeated consignment shipments on the same basis, the result being that there is an over-stocked market there and a decided disinclination on the part of the buying trade to take up stocks at any kind of fair prices, as they can realize much more favorably by waiting for the general market to break as a result of such consignment shipments.

Associations have made an effort to get under this matter and put a stop to it, but it seems to be beyond their scope, as the small shippers are probably the chief offenders. In fact, it seems to be almost impossible to check this tendency, and probably it will continue until the domestic market has so shaped itself that consignment shipments are no longer necessary.

Decline in Lumber Exports

THE EXPORTS OF LUMBER and other forest products for January of this year were twenty per cent below those for January last year. This state of affairs is shown by the latest figures published by the Bureau of Foreign and Domestic Commerce of the United States. The various items which make up the totals are given, and it is possible to determine along what lines the principal decline has occurred. Increase is shown in a few instances. Hickory logs this year were exported in three times the quantity shipped last year. Douglas fir lumber increased about forty per cent. This is a Pacific coast wood, and does not come into sharp competition with any other American wood, and it has practically a world wide market. Redwood, another Pacific coast product, shows a similar increase in exports. The exports of spruce were much larger this year than last. This lumber is cut from both eastern and western species, but chiefly from the red spruce of New England and Sitka spruce of the Pacific coast. It thus appears that Pacific coast lumber makes up most of the increase in exports.

Small increases are shown by some manufactured articles, like box shooks, barrel heading, and empty barrels, but in none of these is the gain of much importance.

A very different showing is made in itemizing the figures which measure the falling off in exports when the past January is compared with that of 1913. Almost every item is on the wrong side of the ledger from the view point of the American exporter. The slump in the total for round logs exceeded fifteen per cent, notwithstanding the fine showing made by hickory. Hewed timbers did almost as poorly, while sawed timber exports fell off nearly sixty per cent, that is, from a value of \$1,018,126 in January, 1913, to \$436,923 in January of this year.

The results are equally discouraging in many items of the sawed lumber exports. Every one of them, except the three mentioned above, fell off. Red gum nearly held its own; oak dropped ten per cent; white pine about the same; longleaf pine lacked eighteen per cent of equaling last year's figures; shortleaf pine was seventy-five per cent in the bad; yellow poplar was only about twelve per cent under former figures; joists and scantling were sixty per cent below; while shingles made the exceedingly poor showing of only ten per cent of the total for January last year. Barrel shooks dropped below half, staves nearly to half, and so on down the line of doors, sash, blinds, furniture, woodenware; and even wood pulp fell fifty per cent below last year's figures.

The imports from foreign countries were almost exactly the same for the two Januaries, the decline not amounting to one per cent. The most noticeable falling off was in Spanish cedar, which is a cigar-box wood. Mahogany showed a slight decline, as did sawed lumber; but the import of shingles increased more than forty per cent, and wood pulp enough to offset all declines in other products.

It would be difficult to find a reason for this regrettable decline in exports that would be satisfactory to all. The plain truth is that lumber dealers in this country are losing the foreign markets. This may be temporary. A single month is not time enough to warrant a positive conclusion on the subject. Apparent losses may be made good when later returns have been received, and business may look better. Every good American would like to hope so; but "hope is desire with some expectation," and though the "desire?" is strong, there does not just now appear to be much ground for the "expectation."

It may not be too late to get that increase in trade which the removal of the lumber tariff was to bring. Such increase may be on the way, but lumbermen have not yet become aware of its arrival.

The summing up of both imports and exports shows that the people of the United States are buying about as liberally in foreign lumber markets as they were last year, but they are not selling so much; consequently, the balance of trade in this line is turning against us.

The Future Price of Lumber

IT MAY BE ACCEPTED as a certainty that the price of lumber in years to come will be higher than it now is, or than it has been in the past. The days of cheap lumber are nearly over in this country, and industries which depend upon wood must accept the change which is coming. The change will not be sudden, nor will it be brought in by any violent disturbance of conditions. It has been on the way a long time, and has been arriving for some years.

The price of lumber heretofore has been fixed by the cost of stumpage, the expense of cutting, sawing, selling, and interest. Precisely these factors will continue to fix the price in the future; but there is bound to come a radical readjustment in the cost of stumpage. The other items of cost may remain much as they are now.

It is an old story, often told, how Nature produced the forests from which past supplies have been cut. Nature did this cheaply, because she did not buy the land, did not pay taxes, and time was no element of expense; but Nature is now getting out of the timber business and is handing it over to men. The future lumber must come from forests owned by men, cared for by men, and every turn will cost money, and all expenses must be paid before the lumber can be used by the final consumer.

Although Nature produces trees more cheaply than men can do it, yet men can produce more on a given tract and in a given time—but it costs more. The improvements which will come in forestry will consist in getting rid of worthless species, the weed trees, as they are called; in keeping the stands thinned sufficiently to secure the most rapid growth; in cutting at the right time and in the right way; but this costs, and the ultimate consumer must pay the bills.

There are now supposed to be 2,800,000,000,000 feet, board measure, of standing timber in the United States. This is merchantable timber, and does not include scrub stuff, tops, limbs, and scraps. The annual drain upon this timber is not known. Some of the largest items have been carefully determined, such as lumber, ties, pulpwood, and distillation material. Other items have been estimated, of which fuel is usually considered to be the largest. But some of these items, as fuel, pulpwood, and distillation wood, do not come wholly, or even chiefly, from what is classed as merchantable timber.

The annual drain upon merchantable timber has been variously estimated, but the equivalent of 100,000,000,000 feet, board measure, is conservative. If this figure is taken, the timber now standing will meet demands for from twenty-five to thirty years. This takes no account of new growth. It has not been customary in the past to pay much attention to annual growth; but it is here that the change is coming, and it will be a square face-about. In the future, the old stand will be depended on less and less, and the yearly growth more and more, until finally the annual growth will be the only matter considered, because the whole supply will come from that source.

Price will depend wholly upon cost of production, and the items will be known and counted. The change is under was now. The torester is beginning to produce timber; but thus far he has not teen able to compete with timber that grow without costing anybody anything. The wild timber is still regulating lumber prices, but before a great while the woodlot and the protected forest will do that. Prices must gradually go up to cover the increasing cost of production.

There is no occasion to sound an alarm or predict catastrophes. The change that is coming will be so gradual that everybody can get used to it. No one will be taken by surprise; but nevertheless the change will come, and the first effects will soon be noticed.

There is land enough in this country to supply lumber to everyone who can pay the price. Foresters and woodlot owners can grow from 150 to 400 board feet per acre every year. That is two or three times as much as Nature is in the habit of doing in her haphazard way on wild land where all sorts of trees, good, bad, and indifferent, are mixed.

When a farmer has paid taxes and other expenses for fifty years on a woodlot, while it is getting ready for the saw, he will count the cost when he fixes the price on sale day, and the purchaser will have to pay it, because he can not buy timber any cheaper elsewhere. The lumber business and all the wood-using industries of this country are moving slowly and surely toward that end.

Forest Conditions and Stream Flow

THE THIRTEENTH ANNUAL REPORT of the Indiana State Board of Forestry recently published contains a paper by Glenn Culbertson of Hanover College discussing the effect on stream flow which may be traced to deforestation among the hills of southern Indiana. Historical evidence is cited to show that profound changes have taken place. The original forests were unbroken in that region: but lumber operations and clearing land have reduced the wooded areas ninety per cent and the remaining stands have been thinned and culled until at this time they contain less than one-third of the number of trees that formerly grew there. The changes which have taken place in the flow of streams and in wells and springs are remarkable and are matters of common knowledge among the people. In times of drought many springs and wells go dry which formerly did not do so. In many instances water must be hauled one or two miles to supply farm stock during rainless periods. Before the hills and ravines were bared of trees this was not

Formerly the streams rose slowly after a rain, and the flow was regular and lasted until the next rain. Now the flood comes with a rush and is quickly gone. It sweeps down the slopes while rain is falling, and has little time to soak into the soil; consequently, none is stored beneath the surface of the ground to feed the springs and wells during succeeding spells of dry weather. Speaking particularly of certain water courses under his immediate observation, Mr. Culbertson says that within the past ten years these streams have repeatedly had record making floods. "The average immediate run-off of such streams as obtain their water supply from the hills referred to," he continues, "must have varied enormously with the change from the completely forested condition of the past to that of the present. Then there was an universal leaf mulch and a deep, porous soil filled with roots and decaying vegetation. As compared to that, there is now a compact sod, a shallow and very compact clay on rock surface. The average annual immediate run-off from these streams today is at least fifty per cent greater than that from the same region under the forested conditions of the past. In many parts of the state wells are being driven to greater and greater depths in the endeavor to obtain a permanent water supply for mills and factories as well as for farm animals."

The changing conditions of flowing streams should be studied locally, as Mr. Culbertson is doing. It can be done to better advantage in that way than by attempting to include too much country in the observations. The clearing of a drainage basin, even if but a few miles in area, affords the means of determining

the effects on the habits of the stream that drains the basin. If it flowed steadily before the clearing and was spacehodic afterwards—now flooded, now dry—it is logical to conclude that the change resulted from the removal of the forest. This has been shown again and again in all parts of the country where forests have been removed. It is common knowledge with most of the people acquainted with the history of such districts; but, unfortunately, few exact records have been kept in the past showing the flow of small streams. It is therefore impossible in most instances to procure precise data in the form of figures.

Every phase of the subject of the relation of stream-flow to forests, where investigations have been made, shows that the stream responds quickly and unmistakably to changes in forest cover. Probably no competent investigator now holds any other view. The complete collapse of the weak effort made a few years ago by Willis Moore, the Chief of the Weather Bureau, to prove that forests did not affect the flow of streams, apparently ended all attempts of anti-conservationists to show that forests could be destroyed without lessening the usefulness of the streams which drain the region.

Large rivers respond to changes in forest cover less clearly than small creeks, because in large basins there are nearly always compensating factors. While some of the tributary streams are pouring out sudden floods, others are running low, and one part of the drainage basin offsets the other in the lower reaches of the main river. Sometimes, however, as in the case of the Ohio floods last winter, all of the small streams rise at once, and the results of deforestation are then seen over extensive areas.

A New Phase of Conservation

I THAS BEEN ADVOCATED by rabid conservationists, since that movement in its most idealistic phases began, that conservation consists of planting little trees where big trees once grew, and tending them with tender care until they reached maturity and merchantable sizes at some distant period when the original investors would have since passed or failed in their examinations for entrance at the golden gate. The practical phases of the proposition were never given due consideration by a great many of the so-called conservationists, and they have never taken the trouble or had the foresight to see this broad question in all of its various phases.

Conservation from a new viewpoint is shown in the state of Wisconsin, where there are thousands of acres of cut-over land which, if the conservationists of the more rabid sort had their way, would be with great labor and expense planted to young seedlings. However, the more practical minds of the owners of this vast acreage have realized that conservation means more than the mere planting of trees or regeneration through natural channels. They have realized that conservation is essentially a money-making proposition and that the only true way to conserve is to husband the actual monetary possibilities dormant in any national resource. As a consequence, instead of entering upon a long series of planting expeditions, they have converted their land into money in the quickest possible manner by inviting immigration into the state through most favorable offers. As a matter of fact, in the last few months there have been sold in the state of Wisconsin something like 500,000 acres of cut-over timberland, all of this territory being opened up to new settlers. Surely no one will argue that this is not conservation, inasmuch as the land, although not strictly agricultural soil, can be made to yield good crops by the proper application, and inasmuch as this development of the country will give to it more real wealth and more remunerative development for the future than would the mere planting of trees.

Of course it is not to be argued that tree planting and natural seedling planting in their proper spheres are not to be commended under practical conditions and can not be turned to profit, but the practical demonstration of up-to-date conservation which has been shown in Wisconsin is an enlightening example of what hard-headed business men can accomplish if they are not tied by idealistic laws forced onto the statute books by impractical idealists.

Yellow Poplar Present and Future

Yellow poplar is one of the most valuable hardwoods of the country. Its natural range covers more than 600,000 square miles from southern New Englant to Missouri and south to Florida and Mississippi; but the highest development of the timber occurs in the central Appalachian region from Maryland to Georgia.

Yellow poplar, considering both diameter and height, is justly entitled to the rank of the largest hardwood species of the United States. Trees of enormous size occurred in the original forests which once covered the bottom lands and rich mountain coves of the region; and a few such trees are still found, though many years of lumbering have depleted the stands where formerly the timber was plentiful.

The time has now arrived when lumbermen and wood users not only consider present supplies but are be_imning to look to the future. Yellow poplar naturally receives much attention. People are asking what prospect there is for poplar after present mature timber has been cut.

An opportune bulletin entitled "Yellow Poplar in Tennessee" has just come from the press of the Tennessee Geological Survey. It was written by W. W. Ashe, who is forest examiner for the United States Forest Service and is a well-known authority on conditions in the southern Appalachian regions. The bulletin is based on his own field work and that of his associates, and the data which he presents is reliable and his conclusions valuable. A summary of certain portions of the bulletin follows:

The greater and more valuable portion of the cut of yellow poplar is the product of old timber. In order that the lumber may average \$28 per 1,000 board feet, the trees from which this lumber is sawed must have, at present prices of lumber, an average diameter of twenty-seven inches, breast-high. Although the amount of young timber which is cut for commercial purposes is small, it has a standard and rapidly increasing value for saw timber. With the continued reduction in the supply of old timber, the second growth must become the chief source of future supply; and consequently it is extremely important to know something of the amount of young growth and its probable future price. It is also desirable to know the rate of growth of the young timber, the possible profit in growing it, and the best methods of management for accelerating its growth and increasing its value.

The results of an investigation in Tennessee show that yellow poplar has a comparatively rapid rate of growth while young; it seeds abundantly and reproduces freely on suitable sites, forming either pure groups or a considerable portion of mixed seedling stands. On account of its soft, white wood, which is very free from large knots, it is merchantable even when of small diameter. while on account of its straight stem with only moderate taper it yields under the saw as large a proportion of lumber per cubic feet of total volume as do the pines. On account of its intolerance of shade its yield per acre is less than that of chestnut and some of the pines, but this is offset by the rapid growth of the individual tree and its vigorous response to thinnings. On the whole, no other species of tree which has a wide distribution in Tennessee offers such excellent inducements for the protection of small trees, and even for propagation and planting. Not only is there an assured and remunerative market for the timber of small sized trees, but its rate of growth is so rapid that returns are obtained at an early period for a forest tree. Second growth trees are largely "sapwood" or "white poplar," but there is now no discrimination against lumber from this grade of timber, and the clear sap lumber at present commands a higher price than the best yellow heartwood did twenty years ago.

Yellow poplar is commercially important throughout Tennessee, but most abundant on the limestone valley lands of the great basin and in the valley of east Tennessee; in the coves and hollows of the Cumberland no attachs, and in the lower coxes of the Unaka and Smoky mountains.

On cut over and closely culled land which has not been hadly burned, there is as a rule a large number of small poplar trees in the coves and hollows. These trees have sprung up in the openings which were made in logging. Occasionally they form a continuous stand in the narrow mountain valleys or form groups, pure or nearly pure, from a square rod to several rods in extent. There is often a far larger proportion of poplar numerically in young stands on cut over land than there was in the original forest. This young timber will constitute a very important element in the yellow poplar supply of the future. On the other hand, on forest lands from which the old yellow poplars were removed before any of the other hardwoods were cut, there is usually a poor replacement of young vellow poplar. There was not enough light for the establishment of vellow poplar, and seedlings of other species which are more tolerant of shade, occupied the space from which the yellow poplar was cut. Where tracts have been badly burned, the young vellow poplar has been largely

In farmers' wood lots there is as a rule a large amount of young poplar, except where the pasturage of cattle has suppressed the young trees, which is the case on many farms. There are, however, many pure stands of young yellow poplar of sapling and pole size, on farms which have sprung up in old pastures that were under fence so that cattle were excluded. While the total acreage of these stands is not large, they can be made, where they occur, extremely valuable if given proper management.

There is likewise a considerable acreage of second growth timber in old coalings. While these stands are largely formed of chestnut and oak sprouts, they generally contain, in the coves and hollows, a larger percentage of yellow poplar than the original forest.

While there is undoubtedly an excellent representation throughout Tennessee of sapling and small pole-sized yellow poplar in second growth, there is a deficiency of large pole-sized trees which night become merchantable as large saw timber during the next twenty to twenty-five years.

Notwithstanding the generally excellent representation of young growth yellow poplar, the future supply of this timber is threatened by the inroads which are being made on the young growth, by cutting it before it is mature, for paper-pulp stock and boxboard bolts.

Yellow poplar reproduces chiefly by means of seed. It reproduces to a limited extent by means of sprouts, but only from small trees until they reach the size of poles; the sprouting of old trees is unreliable. Sprouting is best in full sunlight. The sprouts from trees which are shaded are weak. The seeds, which are borne in small cones, are about one inch long, including the slender wing, and are so light that they may be blown several hundred yards from the parent tree. The seeds from the top of the cone and from the exterior will not germinate. These are the last to fall from the tree, often remaining until the following spring, and in collecting seed for planting they should be discarded. Trees begin to bear fertile seed when about forty years old. Seeds are produced on older trees in great abundance and almost annually, but a large proportion, as a rule about ninety per cent, is infertile. They ripen in September and October and are in great part distributed at once by the wind. They largely germinate during the following spring and the early part of the summer, but some seem to lie over on the ground until the second spring. Germination takes place wherever the soil is moist, and the seedlings easily establish themselves, but they fail to survive the dry periods of the first summer unless on a moist or shady site. Stocking, consequently, is better on north slopes, in coves and hollows or in lower slopes, than on the drier upper slopes and on southern exposures. It is also best where the mineral soil has been exposed, as in oil fields or where soil has been upturned

by logging or by hogs. A thick layer of dry leaves is unfavorable. Seedlings and small trees of yellow poplar are extremely sensitive to fire, being more easily injured even than chestnut. This is due primarily to the thin and smooth bark of the young tree of yellow poplar. An additional reason for their great injury is that the sap and inner bark of yellow poplar become active earlier than in the associated trees. This greatly exposes this species to early spring fires, which, when they take place during dry and windy periods before the forest foliage is out, are very hot and destructive. Fortunately yellow poplar is somewhat pro-

tected by being largely confined to the damp hollows and coves. Seedlings of yellow poplar which are killed down by fire will usually sprout from the root, unless they are shaded.

Mr. Ashe estimates the yellow poplar timber still standing in Tennessee at 2,500,000,000 feet, board measure. If the ratio of annual cut to the amount of standing timber in Tennessee is taken as a basis of estimate, it follows that the remaining stands of this timber in the United States is approximately 14,000,000,000. At the rate of cutting in 1911 this is a supply for twenty-one years.

Wood in Relation to Heat

Wood owes its popularity for certain uses to the fact that it is a very poor conductor of heat. Imagine the result of substituting metal for wood in the manufacture of matches. The user would need asbestos gloves to handle them. It is due to this poor heat conductivity of wood that shingles have one decided advantage over other roofing materials. Anyone who has slept directly under a tin roof following a hot day can vouch for this statement.

This also has a bearing on the substitution of steel for wood in making filing cabinets. It is quite true that the steel will not burn, but this property of metal is not sufficient to guarantee the protection of the paper in the cabinet. If a building is entirely consumed, nothing but a first-class safe or vault can be expected to pass through the ordeal with its contents uninjured. In the case of smaller fires that are extinguished a thin-walled filing cabinet offers less protection to its contents than one made of wood, because immediately after the first contact of the flames with the metal it becomes hot enough inside to scorch the papers. Later the buckling and warping of the case will permit enough air to cause the contents to burst into flames. Where wood is used the contents are safe until the wood burns through—a considerably longer time than when steel or sheet iron is used.

Fire damage to structures is by no means confined to the actual burning. Buildings of stone, brick, steel and concrete are non-combustible but this does not prevent their serious damage and possible collapse due to fire. Where iron girders are used in buildings, in case of the structure being burned, the expansion of the girders tends to shove down the walls; this is not the case with wooden beams because the coefficient of linear expansion of wood due to heat is very small.

By coefficient of linear expansion is meant the increase in its length for each degree rise in temperature, divided by the original length of the specimen. For oak this coefficient has been found to be .00000492. The coefficient of radial expansion for oak is .0000544, or about eleven times the longitudinal. Spruce expands less than oak and the ratio of longitudinal to radial expansion is only six to one. Metals and glass expand equally in all directions since they are homogeneous substances, while wood is a complicated structure. The coefficient of expansion of iron is .0000285, or nearly six times the coefficient of linear expansion of oak and seven times that of spruce.

The expansion of wood due to heat can be determined only when both the wood and the air in which it is placed are absolutely dry. Otherwise the heat drives out the water and causes a shrinkage that not only counteracts the expansion due to the heat, but may even produce a reduction in volume. Since wooden beams and girders always contain at least a small percentage of water, the occurrence of a fire would not cause any appreciable expansion at all. In the case of metal, however, the question of contraction and expansion with changes in temperature presents many serious problems that cannot always be overcome.

Fire-proof construction is not determined entirely by the combustibility of the material of construction. Even more important are the nature of the contents, the design of the structure, and the precautions taken against fire. When the entire contents of

a building are consumed, possibly including loss of life, it is rather small consolation to know that the blackened structure still stands. As a building material for houses in the less crowded areas, by far the larger percentage of all houses built, wood is a convenient and excellent material and the fire damage is little if any increased by its use.

It is by no means so easy to destroy a large wooden beam, post or girder by fire as many people think. Finely divided wood burns rapidly but large solid or closely bolted sticks of most woods show great resistance even to intense and continued heat. The surfaces char readily but owing to the fact that wood is a very poor conductor of heat the inner portions remain intact and strong for a much longer time than is commonly supposed. Heat increases the pliability of wood only when special precautions are taken to retain the moisture. Hence a wooden beam or support, unlike metal, will not soften and thereby buckle and bend when heated, even though the surface is glowing.

Not enough attention has been devoted to the important question of making wood more fire resistant by chemical treatment. Although there are many patented processes on the market only a very small proportion of structural timber is fireproofed. One of the principal reasons for this is the cost and the inconvenience of treatment. It is also claimed that certain processes increase the hygroscopicity of wood, interfere with ease of working with tools, and cause paint to scale off. It is interesting to note the recent increased interest in this work which offers such a fruitful field.

S. J. R.

The Boxes Come Back

The Chinese are shipping eggs to this country in large numbers, and some of them are in the markets as far east as the Mississippi river. The eggs are stamped, each with Chinese letters, which are supposed to be a certificate of freshness. An interesting feature of the shipment of eggs from the old world to this is that they come in American-made boxes. The shooks are manufactured in Washington, Oregon, and California and are sold in China for the egg trade. For a time the eggs went to England and other European countries, but the ever-watchful Chinese saw a chance in America and they were quick to take advantage of it. There is food for reflection in the fact that the Chinese can buy boxes 6,000 miles away, fill the boxes in the interior of their country with eggs, and ship them 8,000 miles to the Mississippi valley, and there undersell the eggs produced in Missouri, Iowa, and Illinois. The boxes must pay freight on at least 14,000 miles of carriage by land and sea..

Practically the same thing has long been occuring with tea boxes. It was formerly customary for tea merchants in Scotland to buy yellow poplar lumber in the United States, transport it to Glasgow, there manufacture it into shooks and send them to China, where the Chinese completed them and covered the outside with paper and inside with tin foil. Many of these boxes came back to the United States filled with tea. The custom has not yet wholly ceased.

Filing Band Saws for Hardwoods

There is just as much difference in filing band saws for mixed hardwoods and for soft woods as there is between night and day. The outputs of a day's sawing of hardwood and of soft woods are so divergent as to quantity as to be scarcely believable to one without experience in that line. When a mill equipped with a band and re-saw has sawed for five or six years in soft wood and then is run on hardwoods for three or four years, and on about a dozen different kinds every day, it is possible to begin to judge the difference in the outputs of the two types of wood. A band saw filer will then fully realize how much more difficult his work is and will be confronted with the fact that the output of a day's cut is anywhere from twenty-five to thirty per cent less in hardwood than in soft wood.

Comparing saw practice or fitting in soft wood with that of hardwood a radical difference will be found in the fitting, the shape of the teeth and the bench work, and the mill must be in perfect condition to get the best results. Suppose a mill saws hemlock or spruce; all the equipment is supposed to be in proper order, but yet the finer points aren't as essential to get good results as when sawing hardwoods. Mills that cut hemlock and spruce are sawing material that is used mostly in the rough. If it is a little snaky or if some pieces aren't just the standard thickness, they will go on the market just the same, but in hardwood it is a different proposition altogether. In that case stock is cut for furniture factories and all kinds of fine woodworking establishments, and in every case the demand calls for perfectly sawed lumber. A furniture factory can come nearer making a No. 1 out of a No. 2 common than it can to making a crooked board straight. It isn't only that that decreases the cut of a hardwood mill. It is the getting the best out of logs that keeps hardwood lumbermen in business and when good sawyers make good grades, logs must be handled three or four times more than when sawing soft wood so it can easily be seen why the cut falls off so much changing from soft wood to hardwood. The question might be asked "if the cut decreases so much why is the filing of the saws more difficult?" That is the result of handling many different kinds of wood. Most hardwood mills cut red and white oak, sugar and soft maple, chestnut, basswood, poplar, cucumber, buckeye, birch, beech, and ash with a small per cent of wild cherry which makes thirteensurely enough to make a filer sometimes think it is an unlucky number. The difficult thing is to so fit a saw that it will stand up to the requirements of so many grains and degrees of hardness and do equally good work in each. I believe that basswood should be sawed by itself because it is almost impossible to saw it mixed with sugar maple, ash or oak, owing to its fibrous nature which requires more swage on saws.

As I have said before in the fitting of saws for hardwood there are several essentials to first class work as follows: The right book and pitch of teeth, the right throat room, the right tension, the right fitting of cutting points, the absolute accuracy of the back, the proper condition and speed of the mill, and more important, the proper swage. When a mill starts to saw hardwood it should be repaired thoroughly; all gearings and bearings should work snug. Especially is it necessary to have the band wheels ground more frequently than in soft wood as more or less dust gets on the wheels, the logs are more gritty, the wood is much harder, causing more strain on the saws and naturally the edges of the wheels wear much sooner. The carriage should be kept in first class condition. Should it have a little play, seemingly not enough to hurt in soft wood, or should the set works have a little lost motion-even 32 of an inch-it will cause lots of trouble sawing high-grade hardwood. The carriage track requires more attention, the tremendous weight of sugar maple, ash or oak falling on the head blocks while handling the logs so much oftener with the nigger, causes it to get out of level and out of line so much more quickly. Another very noticeable defect often found is that in cutting the last cut of a log the board dogs aren't in good enough

holding and working order to prevent the two or four inch cant from springing. As a result there are often dozens of thick or thin boards in a day's cut.

The speed of the mill very frequently has much to do in making crooked lumber. Some millmen think if they speed a mill up like lightning it ought to go through the cut of a log like lightning. A mill with a speed of ten or eleven thousand feet per minute in soft wood does the work nicely, but to try that speed in hardwood without changing the spacing of the teeth in the saws means so many miscuts in a day and so many saws that the mill could not be run successfully. About eight or nine thousand feet is the best speed. With speed conditions satisfactory and a good sawyer the mill will do up-to-date work provided the saws are put up in good shape.

When fitting saws for hardwood it is very important to give the teeth more attention. A little less hook should be carried. If the filer is accustomed to extreme hook in soft wood it should be about one-fifth less in hardwood. By pitch I mean back of teeth—they should be lowered so as to have more clearance on back of teeth in sawing some hardwoods. Pitch is liable to gather on a high back tooth and cause it to snake. The depth of the tooth should be full $\frac{5}{8}$ of an inch in frozen timber and about $\frac{1}{16}$ more when the timber is not frozen. A nice round throat such as common sense dictates is very essential to assist in throwing the sawdust out easily.

The bench work on the saw requires the finest kind of work in hardwood or else "bull heads" and "snaky" lumber will result. It is necessary to look over the saws every day. Hardwood sawing requires more tension along the edges of the blade and it seems impossible to level them too much. All small lumps should be removed because the more level a saw is the smaller a swage can be run and the less chance of the saw getting hot. The back of the saw must be kept in such a condition that it fits the back gauge the whole length of saw without any variations whatever. Too much oscillating isn't beneficial to saws in any kind of wood as it seems to throw them out of balance, especially as they enter the cut on large logs. A saw that oscillates also has a tendency to cause band wheel boxes to run warm. It is a good idea to run the back of the saw with a crown of about 1/64 or do of an inch in five feet. That makes the tooth edge the tightest. When the strain is on the saw in hardwood, very often the tooth edge gets warm, in which case the steel expands and if the saw is run without a crown or with a straight back it makes the tooth edge the longest and therefore not tight on the cutting edge. The result is the saw snakes very easily.

The most important question is the amount of swage a filer runs on his saws. If an estimate could be made of the amount of timber that is cut into sawdust by excessive swaging, it would be astonishing. However, I believe most filers are trying to do justice in that respect. In some cases millmen are constantly causing trouble and making bad lumber by forcing their filers to run saws with not sufficient swage; but filing saws in hardwood in clean logs on a seven and eight gauge swage on fourteen saws is entirely too much. Some filers swage a saw every three or four runs. Of course that saves work but not lumber. The best and most economical plan is to swage light and often-to make lumber-not sawdust. It requires a few more emery wheels and is a little harder on filing room machinery but the cost of that is small compared to the amount of lumber saved. In sawing gritty logs a nine gauge light is plenty of swage. If the logs are clean nine gauge tight is sufficient. If all these things are adhered to a sawmill is sawing hardwood at its highest efficiency.

As the date of the Forest Products Exposition approaches plans are becoming more fully developed. Most of the lumber associations and large machinery houses are planning elaborate exhibits, while the Forest Service is now assured of \$10,000 for its display.

Troubles of the Dimension Man

An interesting sidelight on the dimension stock business was developed recently by a well-known lumberman, who is confining his attention exclusively to the manufacture of dimension stock for use in wagon and plow manufacture. The company with which he is connected is controlled by a large concern in the farm implement field, but is operated entirely independent of it. The manufacturer buys from the subsidiary if the latter can make as good prices as its competitors; otherwise, the competitors get the business.

Obviously, it is up to the dimension company to make good on its merits, entirely independent of the parent company. Consequently it is interesting to learn from the manager of the hardwood mill that the business thus far has been very unprofitable.

In discussing the reasons for this condition, and pointing out the defects of the present system of doing business, the dimension stock manufacturer recently made the assertion that the cost of the material that goes into the mill is not properly figured. That is to say, he took the ground that the cost of the material should be figured not at the cost of getting it out of the woods and to the mill, but at its market value as lumber. In other words, if the piece which is to go into dimension stock would be graded as a No. 1 common board, its value, from the standpoint of material cost, should be figured at the regular price of No. 1 common.

That this is the true basis for figuring is evident from the fact that unless such a basis is used, there is no justification for cutting the stock into dimension. The excuse for the latter operation is that it makes better material with less waste, and consequently adds to the value of the material; but if this value does not appear in the price charged for the finished product, the manufacturer is confronted with an equation which is not true.

As the lumberman referred to says, "We claim that every cant that goes into the dimension mill should be graded according to the rules of grading lumber, and the cant charged up to the dimension department at just what it is worth as green lumber. For example, if firsts and seconds are worth \$40 per thousand in green lumber, and the cant would make a first and second, the dimension mill ought to be charged \$40; if it is No. 1 common, worth \$25, the dimension mill should be charged \$25; if a No. 2, worth \$13, the mill should be charged that. In this way the dimension mill would be required to show profits, over the cost of green lumber, after deducting the cost of labor and waste.

"The average dimension mill operator doesn't figure his material in this way, however, but in about the following manner: If stumpage amounts to \$6, logging expense \$4, overhead \$2 and sawing and handling expense \$2.50, making a total cost of \$14.50, this is the charge made to the mill for the material. And if a showing over and above this is made, after deducting the other charges, the millman regards that as profit. This is a fatal mistake, for the material is thus put in at considerably less than it is worth.

"If 4"x12" first and second green plank is worth \$55 at the mill, what is the sense of cutting it into wagon poles and getting only from \$49 to \$50 for the poles? This, on its face, appears to be a ridiculous proposition, and yet that is what is happening in the dimension business right along. The manufacturer who does this is out \$5 per thousand feet, besides the cost of manufacturing the poles. In addition one or two rejected poles may be made from the same plank, again reducing the margin, while a 12" plank in a grade of firsts and seconds would admit two or three defects that would make a rejected pole, if a pole should be sawed out of it.

"The whole theory used by the average concern cutting up dimension stock is wrong, for the reason that it doesn't figure what the stock is worth before it is cut into dimension. That it is cut out of waste is no reason why the man who buys it should get it for nothing. If Jones agrees with Smith to deliver so many

pieces of a certain size, absolutely perfect, it is none of Smith's business if Jones gets those pieces out of slabwood or gets it out of the very best of lumber. He fills his part of the agreement by furnishing clear pieces. If Jones could not buy the pieces, he would have to buy the lumber, and by doing that he would soon find that the price he is offering for piece stuff is low, considering the waste involved in getting it out."

Another inconsistency noted by the same manufacturer, who has studied the dimension business from a good many angles, is that the manufacturer who buys dimension at a low figure because he convinces the millman that its selling value should be below its intrinsic value, does not pass the benefit on to the consumer, but charges just as much as though the stock had been cut out of firsts and seconds.

The typical conversation between the dimension manufacturer and the chair manufacturer, for example, is about like this:

After being quoted a fair price, i. e., one that will show a profit to the dimension man, but still is less than the net cost of lumber cut up by the chair manufacturer, the latter says, "Oh, I couldn't pay anything like that."

"Why not?" inquires the dimension man. "You have been buying No. 1 common and cutting this stock out of it. The price I am making you is less than you may possibly get by cutting your stock out of No. 1 common lumber."

"That's all right," retorts the chair man, "but you will go back to the mill and cut my order out of slabs, edgings and other waste."

If the dimension man knows the chair manufacturer well enough, he may say, "Now, Jim, it is none of your affair what I cut this stuff out of. I agree to furnish you so many pieces of a certain size; manufactured out of clear stock. If I do this, it doesn't matter to you what I make it out of."

Assuming that the chair man, by hammering on the origin of dimension stock, succeeds in getting a much lower price than he is entitled to, would it not be proper for him to quote his chairs to the retail furniture dealers at a lower price on account of having made them out of material which originated in the waste of the sawmill?

"I have often wondered," says the dimension manufacturer whose views are quoted above, "what would happen if the retailer met the chair man with this argument: 'You are too high, because I happen to know that you are buying all of your rough material from Jim Brown, who cuts it out of scraps from the mill, at \$10 to \$15 a thousand under the price for lumber. You ought to be able to sell us the chairs at a lower price.' I wonder if the shoe would fit the chair manufacturer's foot. What do you think about it?"

The views of the dimension stock man referred to have been quoted at length because they are a forceful expression of conditions as they exist in the industry. That dimension stock is sold at too low a price, and that as long as this condition prevails normal growth or permanence can be expected of the business, is a matter of common knowledge. But the arguments put forward indicate that the chief reason for the low prices may have been overlooked. The fact that it is the intrinsic value of the wood that the consuming manufacturer is interested in, and not the manner of its production, can hardly be too greatly emphasized; and on the other hand the point that the cost of the material which goes into the dimension mill should be figured at a fair market price of the wood, regarded as lumber, is all-important, because if the dimension man takes the wrong basis as a means of figuring selling prices, he is sure to go far wrong.

Perhaps the dimension men ought to take a cue from the other branches of the industry and begin a study of costs along really accurate and scientific lines. The installation of a modern cost system would show the expense of handling each operation, as well as the cost of the material itself. Armed with the results of a system of this kind, which could be presented, if necessary, to the buyer of dimension lumber in support of the prices asked for the material, members of the trade might be in a better position to ask and get the kind of prices that are necessary in order to make the business self-supporting, and therefore stable and permanent.

Pertinent Legal Findings

RIGHT TO RESCIND TIMBER CONTRACT

One who contracted to buy standing tumber was entitled to resemble the contract and recover the price paid on discovering that the timber was on a different tract of land from that he had in mind, he having never been in the locality of the land and having relied upon a report of an agent who examined the wrong tract. This decision rests, however, upon a finding that neither the purchaser nor his agent was guilty of any negligence in failing to ascertain the identity of the timber contracted for. (Arkansas Supreme Court, Fleischer vs. McGehee, 163 Southwestern Reporter 169.)

CONCLUSIVENESS OF SCALER'S MEASUREMENTS

When timber is sold under an arrangement for its measurement by a scaler to be appointed by the purchaser, his measurement is not conclusive against the purchaser, unless the contract so provides. (Minnesota Supreme Court, Owen vs. J. Neils Lumber Company, 145 Northwestern Reporter 402.)

PHASES OF LICENSES TO CUT TIMBER

The right to cut timber from the land of another is a personal property right which may be transferred by bill of sale. The lien of a seller of timber to secure payment of the agreed price is not terminated by his acceptance of notes covering the price. (United States District Court, District of Maryland; Cullen vs. Armstrong; 209 Federal Reporter 704.)

CONTRACTS NOT TO RE-ENGAGE IN BUSINESS

An agreement by a partnership, on selling its business, not to re-engage in the same line of business in the same town in competition with the purchaser will not be construed as preventing one member of the firm from setting up a competing business, unless the contract is so worded as to manifest an intention of the parties to preclude competition by the individual members of the partnership, as well as by the firm itself. It is doubtful that this rule would be applied in all the states, but the Iowa Supreme Court adheres to it in the case of Rapalee vs. John Malmquist & Son, 145 Northwestern Reporter 279. The position taken by the court is that, since such contracts are disfavored by the law as tending to restraint of competition, they will be given no broader effect than was clearly intended by the parties.

PROTECTION OF TRADE-NAMES

In deciding that a company which had established a valuable reputation as manufacturer of "security ladders" was entitled to enjoin a newly organized rival company from adopting the name "Security Ladder Company," the Indiana Appellate Court recently announced this principle of law in the case of Hartzler vs. Goshen Churn & Ladder Company, 104 Northeastern Reporter 34: Any conduct which naturally tends to deceive the public as to the source of manufacture of an article constitutes unfair competition with the aggrieved manufacturer, against which the courts will grant relief. This principle is not restricted to cases where a manufacturer has acquired a technical right to the exclusive use of a trade-mark or a trade-name, but extends to marks and names, which, though originally not subject to exclusive appropriation, have come to be understood by the public as designating a particular product. In announcing this last mentioned rule, the Indiana court follows the doctrine which is announced by all the courts to the effect that, although all persons engaged in the same line of business have equal right to use geographical, descriptive or personal names to designate their product, the courts will enjoin one manufacturer from adopting such a name after it has been previously appropriated by a competitor and has come to be understood by the public as identifying the latter's promet. So in this case, the word "Security," as applied to ladders, would probably be held by all the courts not to be subject to appropriation as a valid trade-name, since every manufacturer of a safe ladder is, in the first instance, entitled to use any word of the English language which is descriptive of that quality. But, manifestly, after the trade has come to understand that a certain brand is produced by a certain manufacturer, use of its name should be protected against invasion by a competitor. Another principle announced in the case above cited is that, in order to maintain a suit on the ground of unfair competition, it is unnecessary for the complaining manufacturer to show that the trade has been actually deceived by defendant's use of the same name, or that defendant intended such deception; it being sufficient to entitle plaintiff to relief that there is a tendency to deceive the public.

LIABILITY FOR ESCAPE OF FIRE

The legislature of a state may validly provide that one shall be liable in double damages for injury caused another by the former negligently or willfully permitting fire to escape from his premises, but a law fixing liability for actual damages ensuing from a purely accidental or unavoidable fire is invalid.

WAIVER OF DELAY IN DELIVERY

A buyer's acceptance of goods after the date when the seller has contracted to deliver them waives any right to rescind the contract on account of the delay, but does not prevent the buyer from making a claim for damages resulting to him through the seller's failure to make the delivery within the stipulated time.

Baltimore Export Figures Startling

That the decline in the export business is not a mere transitory development, yielding after a short time, is again plainly shown in the statement of shipments from the port of Baltimore for February as compared with the corresponding month of last year. This statement discloses a falling off in the forwardings that amounts to more than fifty per cent and does not leave any reservations, the conditions having been such that the reduction must be attributed to unsatisfactory trade conditions abroad, and not merely to exceptional circumstances. It is again oak which shows the greatest reaction, this wood having being in such plentiful supply abroad or perhaps the requirements being so low that prices dropped below the level of which there could be any thought of the shippers here coming out with a margin. Poplar and practically all other woods were affected by the unprofitableness of the foreign markets, and the situation had become so bad as to effectually check the shipments. The state of the export business for February is strikingly shown in the export figures, which contain the following facts:

	1914.		191	3.
LOGS.	Quantity I	et. Value.	Quantity F	t. Value.
Hickory	40,000	\$1,422	190,000	\$15,949
Oak			4,000	100
Walnut	120,000	6,867	166,000	12,836
All others	50,000	1,964	33,000	1,240
LUMBER.				
Oak	807,000	26,482	2,445,000	82,723
White Pine	3,000	116		
Poplar	155,000	8,056	205,000	7,526
Spruce			43,000	1,100
All others	137,000	6,894	257,000	10,840
Staves	3,953	415	81,517	8,015
All other kinds of lumber		12,025		10,130
Doors				9,164
Furniture		1,118		2,375
Trimmings				1,484
All other manufactures of wood		20,514		37,601

The Lumbermen's Round Table

PRICES AND CONSUMPTION

A prominent manufacturer of oak and poplar recently made the assertion that the prices at which lumber is sold have no effect on the quantity used. He took the ground, for instance, that just as much plain oak would be cut up if it were selling at \$60 as at \$50.

"Oak is oak," he declared. "There is nothing like it, no substitute for it. Consumers will pay whatever is necessary to get it. The cost of the lumber is a minor factor in determining the price of the finished article, because so little of it is used in any one piece. All we've got to do to get the price is to ask it."

Several hardwood men who were present took exception to this statement, pointing out that the present condition of plain oak is largely due to the substitution of cheaper materials for oak, this being particularly true of the interior finish field, where gum, cypress and other woods are being used in place of oak, simply to save the difference in cost. That the consumption of poplar has fallen off because the price went too high for consumers to stand is also generally admitted. In fact, it may almost be stated, as a proved theorem of the lumber business, that when the price of an article becomes so much higher than other materials that the difference in quality is less than the difference in price, substitution will begin.

Most oak men, for instance, would prefer to see the market for oak steady and consistent at an average price than to have an irregular market, resulting from an extremely high price.

THE VALUE OF ASSOCIATIONS

A successful lumberman, who has won his way to the top largely by his own unaided efforts, is of the opinion that associations and conventions are all right from a social standpoint, but don't amount to much as far as practical benefits are concerned.

"Some men like to be president of this, or director of that," he said, smiling good-naturedly, "and for those who enjoy that sort of thing, the association is a great institution. But I can't see where anyone has ever been benefited by belonging to an organization of that kind."

It developed later in the conversation that this lumberman had lost the value of several carloads of lumber, a customer going broke in a very thoughtless and ill-timed manner.

"Wish I had known that chap was in a bad condition," remarked the manufacturer. "I had my doubts about him, but thought I'd take a chance."

"Do you happen to know," demanded his companion, "that one of the leading associations furnishes credit information of just that kind? I had an order from the same people, but got information from the association that saved me from shipping the stock. I figure I saved \$750.

"Doesn't that show that an association pays?"

" "Yes, I suppose it does," the other finally admitted.

And the facts usually are that the man who makes use of his association properly, and doesn't content himself merely with attending annual meetings and enjoying the good fellowship which they involve, will find that organization work pays in a very definite and measurable way.

ON FORCING SALES

"I'm not in the market for lumber at this time, and don't care to buy," said the manager of a large interior trim plant in the Mississippi valley. "I'm pretty well stocked up, and haven't finished using up a big lot of plain oak I bought last fall in expectation of big business around the first of the year that didn't develop. We're busy now, however, and so I think I'll be ready to buy again in a few months.

 ${}^{\prime\prime} I$ wouldn't buy lumber and put it into stock under present conditions; but if somebody comes around and offers to give me

a car, as a lumber salesman did today, of course I'll take it. Bu nobody can sell me lumber at present."

This remark shows, perhaps, that the price-cutter can always get orders by giving his lumber away; but that sort of business can hardly be regarded as profitable. It also shows that consumers who are really carrying a fair stock can be forced only at the expense of the seller, and that it is better to wait until they actually want to buy before trying to close a sale.

A little conservatism in times like these is worth a great deal more than the spirit which is aggressive to the point of getting orders even if they have to be bought.

MANUFACTURING VERSUS SELLING

"Which do you think is the more important department of the business," an old-timer was asked, "running the sawmill or the sales department?"

"It all depends on what you call being a good lumberman," replied the veteran manufacturer, who has several mills and is therefore qualified to speak with authority.

"My own idea is that the good lumberman is one who can take a pile of stock, equal in quantity and grade to some other lot of material, and get the most money out of it. That may not accord with the views of some other people, but it's the final test. The man who gets the money is the best lumberman, no matter whether he is technically as efficient a manufacturer as some other chap.

"I know some lumbermen who never see beyond their yards. They have no conception of the selling end of the business. That means that they have to take a lower price for their stock than the man who understands consuming conditions and can take advantage of the various features of the market which are a closed book to the manufacturer of the other type, whose only idea is how to saw up a log to the best advantage.

"Given a mill with fair management, you can figure on getting within three or four per cent of the quantity and quality of lumber that another mill, operating under the same conditions, will get. In other words, most mills, provided they are run with ordinary efficiency, reach just about the same results.

"It's after the lumber is in the pile and must be converted into money that the real test comes. I've always been my own salesman, and I know that I can make more money going out and making arrangements to supply a factory than I can staying at home and looking after the operations of my sawmill.

"I believe that covers the points involved, doesn't it?"

SUPERINTENDENT OR LABORER?

Speaking of running a sawmill calls attention to the fact that a good many superintendents forget that they are paid for their ability to get results out of other men, rather than to do the manual labor themselves.

The head of a big mill said recently that his superintendent would be worth \$2,500 a year more if he could learn to supervise and to confine himself to that kind of work.

"He's the sort who is always rushing forward and taking hold of a job himself," said this lumberman. "His place is to look on and direct, and to see what the men are doing, instead of trying to do their work himself. We can get labor for \$1.50 a a day; when we hire a superintendent we want him to superintend, and not to be one of the sawmill crew.

"Cocasionally it may be all right for the superintendent to show a man how a thing ought to be done, as part of his instruction in the business; but to make a practice of doing work which a much cheaper man could do just as well is to waste time that could be put in to much better advantage."

This sounds like a topic that would be worth general discussion. What are your views on the duties of a superintendent?

Correcting Wood's Infirmities

When nature's open air laboratory, which uses sunshine, water, carbon, and other things, discovered flow to make wood, it was a great discovery; but there were defects, things left incomplete, and it is man's job to finish the product. Wood is far from perfect from the standpoint of man's utilization. It has three serious shortcomings, which may be called its infirmities, and these have always limited the use of the material and caused bother, worry, and expense.

These infirmities are decay, distortion, and combustibility; that is, wood will rot, it will warp, and it will burn. If these undersirable characteristics were lacking, wooden structures would last like stone; but they are not lacking, and the modern problem is to correct them as far as possible. There is no new story to be told regarding efforts to cure these defects; but there is constantly something new in successes achieved. Men are learning. They are profiting by experience, and the advance in scientific investigation is constantly opening new fields and showing the way to reach better results.

There is little that is mysterious about decay, at least as to its immediate cause. It is brought about by the activities of plants of a low order called fungi which take root in the fibers of the wood and there grow and send their roots or stems through the substance, using up the starch, sugar, and other soluble materials, and breaking the minute structures to pieces in order to get this food. The word "decay" means "falling apart," and that is exactly what happens. The binding substances that hold the fibers together are eaten away, and the wood simply falls apart, and is then said to be rotten.

This proneness to deteriorate may be largely corrected. The pores of the wood can be filled with poisons, by immersing it in accessore or other preparations; and when the decay-producing plants attempt to enter, they encounter the poisons, and are killed. As long as they can be kept out, wood cannot rot. There are many timber-treating plants in this country where this is done, and several processes by which it is accomplished. It is not necessary so to treat timber which is to be kept in the dry, because decay cannot attack in the absence of dampness. Practically all of the wood that has grown on earth, up to recent times, disappeared through the agencies of decay. That which was destroyed in other ways was relatively small; but fire is next to decay as a destroyer.

Wood's inflammability is at the present time a serious weakness. It eatches fire and burns. That which is safest from decay because of its dryness, is most likely to burn. Methods of fireproofing have been discovered. The processes are generally more expensive than are those which suffice to hinder decay. A different enemy must be combatted. Burning is a chemical process. It acts quickly. Decay causes wood to "fall apart;" combustion causes it to "fly apart," and return to its chemical elements at once. Decay acts during years; burning is completed in a few minutes.

Wood may be given chemical treatment which will greatly lessen its liability to burn. It cannot be made absolutely fireproof; but, as in the case of decay, its inherent infirmity may be largely corrected. That is what is being done.

The third weakness of wood is its tendency to distortion. It checks, shrinks, and swells, but complete destruction is seldom reached. This is the hardest thing about wood to be corrected. Attempts have been made for hundreds of years. The seat of the trouble lies in the structure of the wood. It is a substance of the most complex character. There is hardly anything made by man that will compare with it. The unaided eye sees rings, bands, pores, and rays. The lens increases their number and multiplies the details; but the high power of the compound microscope reveals wonders in the minute structure of wood which otherwise are totally beyond the reach of the eye. Yet the microscope does not go to the bottom. If it did the real cause of the shrinking and swelling of wood could be seen, because the ultimate elements would show what takes place when water enters the structure or is withdrawn.

That is a thing which is not understood—why wood swells when water enters and shrinks when water is taken away. It is known that it does so, but why is another matter.

Investigators have theories, It is believed by Karl William Nageli, the Swiss botanist, that the ultimate particles of wood substance are crystals, fitting together like stones in a wall, and that water forces its way between the crystals by means of surface tension or capillary attraction, and in so doing it pushes the crystals apart, causing the wood to swell. When the water is withdrawn, the crystals settle together again, and the wood shrinks. This is theory only. No microscope has ever yet been made powerful enough to reveal the crystalline structure of wood, if it has such structure; but as a theory, it is a cause which explains the universal property of wood to shrink and swell upon changing its moisture contents.

Men have experimented for centuries to discover methods of rendering wood proof against shrinking and swelling. Oils and paints help, because they tend to keep water out, or to lock within what is already there. In numerous instances it is impracticable to oil and paint the wood, and even where it can be done it is only partly successful. Long-continued air-seasoning is beneficial. There is no doubt that such treatment lessens wood's tendency to shrink and swell. Experience long ago showed such to be the case. Old-time hatters air-dried their yellow poplar several years before they shaped it into blocks, curling boards, and patterns. Nearly two hundred years ago Mark Catesby wrote that red gum had to be air-dried during ten years to make it perfect for joinery.

Why does air-drying during a long period change wood so that water partly loses its power to swell it? No man knows; but there must be a reason. If Nageli's theory of the crystals is correct, it may give a hint. Possibly the long-continued and slow contraction of the substance in some way locks the crystals together so that water cannot so easily force its way between them to pry them apart and produce swelling.

Steaming wood is known to produce a similar result, particularly if the steam is applied at a temperature considerably above that of boiling water, and is given sufficient time to penetrate. Shrinking and swelling are decreased in a marked degree. Again, it must be confessed that there is no definite and precise knowledge of why this result is produced. The microscope does not seem to reveal it, and chemistry does not; but if the Nageli theory offers a possible explanation in the case of slowly air-dried wood, there is no reason why it will not apply in steam seasoning also. The application of moist heat, forced through and through the cellular structure, may solder, as it were, the (supposed) crystals together, or fix them in some other way so that water cannot come and go between them freely as before, and, of course, shrinking and swelling is proportionately lessened. Any diminution in the tendency to swell and shrink will of necessity decrease the tendency to check, for the latter depends absolutely upon the former.

The science and processes of correcting the infirmities of wood are as yet only vaguely understood. There are many workers, numerous investigators, and a few discoverers; but those who know the most claim to be nothing more than amateurs, feeling their way along from point to point, but constantly gaining a little. The engineer who treats wood to lessen its decay will not be satisfied until he has discovered a material or invented a process by which the timber can be so completely impregnated with preservatives that fungus will attack in vain, and decay will act only slowly and after long periods. Fireproofing processes must not only be made more effective than they now are, but must be cheapened in order that use may be widely extended. The shrinking, swelling, and checking of wood will be brought completely under control before manufacturers will be satisfied with what they are able to do. Every woodworker and student of timber economics knows how far short of that stage of perfection the present practrees are. Doubtless the real workers and thinkers along this line are often in a frame of mind like Isaac Newton's when he said: "I know not how I seem to other men, but to myself I seem like a

child playing on the seashore, amusing myself by now and then finding a smoother pebble or a prettier shell than my companions, while the great ocean of truth lay all undiscovered before me,"

Noise in the Business Office

What does noise cost?

Time, place, and circumstances must be known before an intelligent answer can be given to that question. It is a fact, however, that waste due to noise is one of the losses to which conservation commissions have not yet given much attention. They have been figuring on nearly everything else from forest fires to the leaching of nitrogen from the soil, but somehow they have missed the problem of saving the human mind from the wear, tear, worry, and distraction of noise.

What has that to do with wood? it may be asked.

The question has a lot to do with wood, and wood will have a lot to do with this problem. The first point is to appreciate the loss due to noise in an hour, a day, or a year, and it will then be time to begin to look for remedies.

Although conservation commissions and efficiency experts have usually passed noise by in their search for other things that want curing, some attention has been given the matter by Dean Sabine, who has collected facts and statistics which tend to show that noise may become one of the greatest, most inexcusable sources of waste that the modern business man must contend against. Such is not true of all situations and at all times; but of many situations and at many times it is true, and when it is true it is a matter that may be clearly demonstrated.

Begin with the modern office, and in order to be precise and explicit, confine the present discussion to the office where modern business is carried on by modern methods. Machines are noisy. The typewriter, the adding machine, the dictagraph, and telephone are not as quiet as the old-time accountants were who worked silently at their desks in situations so still that a dropped pin was always recovered, because its fall was heard, and it was picked up. The confusion in a modern office, particularly if a large one, is often incessant. Experiments have shown that it is wearing on the nervous energy. This is not the dictum of theorists, but the conclusions of business men who know by experience and by observation. Mr. Sabine cites many instances where strong business men have been almost incapacitated by the extra strain on their nerves, due to resisting noise, and fighting against it. The strain and drain are no less on all in the office force. The workers must employ part of their nerve force in resisting the noise, and they can give less to their tasks. They wear threadbare, as it were, before the day is over.

The only way to measure this loss of energy, and consequent depreciation of work, is to compare conditions before and after—the amount and quality of output while conditions were bad, and after the worst of the noise nuisance has been abated. In numerous instances the showings have been remarkable. Lessening of noise results in better work, more of it, and a saving in strength and energy on the part of the operators. In other words, noise and confusion are wastes that must be paid for out of the earnings of the business just as surely as insurance and taxes must be paid.

Many large business houses are seriously considering means for lessening noise. There are various ways of doing it, but no method will be of practical benefit that lowers the efficiency of the machinery and apparatus in use. Best results thus far have been reached by absorbing the noise. It is not so much the sound at the point where it originates which disturbs as it is the echo and reverberation from the walls and ceiling of the room. It is when echoes repeat and multiply the sounds that the confusion becomes distracting. Experience and tests have frequently proved this. Absorb the sounds when they strike the room's walls, the ceiling, and the fixtures, and the confusion largely disappears.

Various devices for doing this have been tried, and their efficiency has been carefully measured. It is found that the best destroyer of noise in a room is the open window. The sound goes out and never comes back. It is impracticable to have open windows at all seasons of the year; and in many instances in cities like Chicago and New York an open window lets in more noise from the street than it lets out. Too many open windows are objectionable in other ways. Some up-to-date offices dispense wholly with open windows and secure ventilation through pipes from the roof.

Next after the open window as a deadener of noise, felt cloth holds highest place. Some offices cover their ceilings and even their walls with sheets of felt. It produces excellent results, but there are serious objections to felt, or any other cloth, on office walls. It is insanitary. If it is fastened at certain points only, so that it may be removed and cleaned, it is unsightly; and if it is tacked or glued tightly against the wall, it speedily becomes highly objectionable. Felt, therefore, has its limits, and the limits are narrow.

Next after felt as a deadener of sound is wood. It ranks in efficiency above plaster on either wood or wire lath, more than twice as effective as glass, and ranks still higher above plaster on tile or brick set in cement. The tests made have been elaborate and far-reaching and they prove beyond a doubt that wood, as a sound deadener for office walls, ranks higher than any other material that can be used in a practical way.

"Many are called and few chosen" is a text that applies here. Almost every conceivable material and combination of materials has had its day as interior finish. They come and go. Some may answer one purpose fairly well, others may fill other places, but after the whole round of trials and experiments has been gone through, wood comes out superior to all. The advocate of substitutes and makeshifts is doomed to final failure in his war on wood.

The cost of noise is coming to be a recognized drain in large offices. It is a waste that can be measured. It is largely an unnecessary waste, and the time is near at hand when no unnecessary waste will be tolerated by the business men of this country. The architect that plans the office must give as much study to ways and means of deadening sounds as he now gives to increasing the acoustics of auditoriums and music halls. Plaster will be rejected in planning the walls and ceiling of the office; glass will be used if not sparingly at least advisedly; and sheet metal will be east into outer darkness; but wood will hold the place which it has always held, because of its unquestioned superiority as a deadener and absorber of sound.

Fortunately for wood, its employment as interior finish does not depend upon a single property. Many persons will continue to use it who have no particular interest in noise or the absence of noise. They will be guided by the beauty of the broad panels or the artistic tones and figures of frames and beams. Stamped sheet metal is a poor substitute for the rich, harmonious colors of the genuine article; and the glassy surface of tiles will be left out of consideration by those who understand the difference between shams and the reality.

Though noise comes high and some may insist on having it in their offices, the investigations which have been begun and the progress already made in attaining scientific results, clearly point the way to the use of wood for finish as the most effectual way of lessening the waste due to the din which some erroneously suppose to be inseparably connected with modern methods of transacting business. Wood has won in the past and it will continue to win because it is efficient, sufficient, and satisfactory as interior finish.

Utilization of Sumach

CHAIN, THE BEEK MICHIGAN

The principal commercial value of sumach has always been in its leaves and twigs which are used for tanning leather. The largest supply comes from the region between New Jersey and North Carolina, from the immediate coast westward to the mountains. Two species contribute to the supply.

Staghorn sumach (Rhus hirta) is so called because the small limbs are covered with fuzz, like the young hours of a deer. Dwarf or smooth sumach (Rhus copallina) has its names because of the smoothness of its branches, and from the fact that the growth is generally small. However, the largest specimens of both species are much the same in size. Trees attain a height of from thirty to fifty feet and trunk diameters range from six to twelve inches. It should not be supposed that these sizes are usual. They are exceptions and are attained only under extremely favorable conditions.

The sumach is a short-lived tree. There seems to be no record of any above fifty years of age. There is a section of a trunk of dwarf sumach ten inches in diameter and forty-seven years old in the collection of woods at the Texas University at Austin. It grew in that state. The species is found from New England to Florida and Texas, but the best development in size is west of the Mississippi river. The range of staghorn sumach is somewhat more restricted in the South and Southwest than that of the other, but it ranges farther north.

The annual output of dried sumach leaves and twigs for tanning purposes in the United States is approximately 180 tons. It is not a large quantity, but it is very rich in tannin of a valuable quality. It is employed principally in preparing fine leathers for book binders and glove makers. Genuine morocco skins are usually tanned with sumach. It gives a softness which is difficult to attain with any other material,

In Virginia the leaves are stripped from the small bushes by women and children, with some help from the more lazy class of the masculine population. It is not looked on as "a man's job," and men prefer to stay away while the field work is being done. The sumach thickets occur in old fields, and the bushes are seldom so tall that a person standing on the ground can not strip the leaves from every twig.

The stands are produced wholly by natural means. Seeds are scattered by wind, water, quadrupeds, and birds, and the worn-out fields, where the soil is so poor that corn will no longer grow, come up thickly with seedling sumachs. There is so much bitter white juice in the leaves and twigs that domestic animals refuse to eat them; consequently, the young sumachs grow without molestation in old pastures while half-starved horses and cattle roam in search of forage.

No particular age is necessary to fit the sumach for the leaf-gatherers. Whoever reaches the old fields first, garners in the leaves. However, there is generally enough for all who care to glean. There is not much profit in it for the gatherers. The material sells for about \$100 a ton, but it takes two or three acres of sumach to produce a ton, and the picking is not all the cost of preparing. The leaves must be dried, flagellated, and baled.

The early makers of maple sugar used sumach stems an inch or less in diameter for spiles. These were made hollow by punching out the pith, and they were then inserted in auger holes bored in the maples. The sap was thus led into the troughs or pails provided for the purpose.

The wood is suitable for a number of uses. Trunks four inches or more in diameter contain wood fit for certain commodities. It is peculiar in appearance. The annual rings are made up of wood yellow and black, in concentric layers. The black is the summer wood. When polished, a fine, rich luster is developed. The sumach is diffuse-porous—that is, the pores are not arranged in rows—but those in the summer wood are often filled with deposits and are therefore not easily observed.

The most artistic display of sumach is seen in turned work,

such as newel posts, spindles, balusters, capitals, and other ornaments. Balls seven inches or more in diameter are sometimes turned, and are highly ornamental when used as parts of stairway and grille work. The contrasts, due to differences in color, are strongly Irought out. Ealls of smaller sizes show well also, but the beauty of the west mechases with the size of the press.

One of the common uses of the wood of this tree is in turning gollets, curtain rings, and small platters and trays. The high polish which may be given such articles is surprising. Though the wood is somewhat lrittle, it is quite strong. The sapwood is very thin, and practically the whole trunk can be used when it is of sufficient size.

Novelty stores sometimes sell sumach balls two and a half to three inches in diameter, intended for use in darning stockings. Next to the wood's beauty in colors and contrasts, its principal value as darning balls is due to the smoothness with which it may be polished. There are no rough places to catch threads.

Poison sumach (*Khus vernix*) appears to be without value, so far as its wood is concerned; but the juice which exudes from wounds in the bark may be manufactured into a rich, black varnish. The danger of handling the article stands in the way of any great demand for it.

There is a western sumach (Rhus integrifolia) which grows in California and attains a trunk diameter of a foot, when at its best. The wood is wholly different in appearance from that of the other sumachs. It is of a rich red, without much figure. Annual rings are indistinct. It bears some resemblance to both cherry and mahogany, but differs enough from both to give it a distinct character of its own. It is hard, strong, and takes a good polish. It is not sufficiently abundant to give it much value as a resource; but for the manufacture of small articles it deserves a prominent place.

Wider Field for Plain Oak Furniture

Plain oak is coming back after years of neglect. Little of it has been in evidence for a long time. Fashion dictated the use of other woods, but fashion in that line has about run its course, and indications point to an early and general return of plain oak in the furniture trade. Quartered oak, also, is due to wider employment in the manufacture of furniture. That is, the oak is extending its field of usefulness in most kinds of furniture. For some years this wood has been confined largely to the office and the dining room. Desks and cabinets of oak have been manufactured in large quantities and in numerous styles, and dining tables, sideboards and other appurtenances of the dining room have followed that fashion. In the making of other classes of furniture this splendid wood was accorded scant courtesy. Birch, gum, maple and other hardwoods had the center of the stage. These are fine woods, but no finer than oak, and the superior place accorded them was dictated by fashion, which is often as much a law in trade as in the social affairs of men and women.

It, therefore, becomes a matter of quiet satisfaction to note a tendency on the part of oak to come into the general furniture field again. Plain and quartered oak alike have a place, and by right they never ought to have lost any part of that place. Their substantial qualities ought to place them among woods like gold among metals, superior to vicissitudes of fortune, and beyond the fickle influences of fashion.

The tendency is indicated by the appearance of oak furniture in show windows, where it is more prominent than it had been in a long time. This is the situation, not in a single city or manufacturing district, but it is so general that the movement cannot be defined as restricted or local. A popular form of library table has a quartered veneer top, while the frame is made of solid plain oak. The table is not elaborately finished. It is simply a substantial piece of oak for the library. Many pieces on display are finished natural, and they afford pleasing contrasts with some of the deep-stained woods.

A Famous Lumber Operation

The details of a noted lumber operation of ancient times are a fenently explicit to make the matter interesting to Lumbermon of today. It was the handling of the timbers used in building Solomon's Temple. The bill of lumber ordered by Solomon, the kinds, and the commissary department which had charge of the feeding of the workman, and the means of transportation, are plainly stated. Hiram, king of Tyre, was the contractor, and the terms of the contract were drawn in black and white. The matter was reduced to writing in letters which passed between Solomon and his contractor. There was stipulation as to the feeding of the workmen, and at whose expense; and the transportation of timber by land and sea. It is not altogether clear how many laborers the contractor was to supply, but the keen business acumen of the Tyrean seems to have tied Solomon up to a specific number.

There was one point which is not made very clear in the extant account of the transaction, and that is the price which Hiram was to receive for cutting the timber and rafting it to the nearest seacoast point to Jerusalem. The price was large enough, as was shown in the final settlement. It is evident that Solomon was unmercitully fleeced in the transaction. He is reputed to have been the wisest of men, but his lumber business did not show it. He paid an enormous sum for a comparatively small amount of lumber, while Hiram came out of the transaction a very much richer man than when he went in. The Tyrean was able to make Solomon do most of the work and pay all the bills.

The lumber was ordered for use in building the Temple at Jerusalem, and certain other structures associated with it. Three kinds of wood were specified, algum, which may have been olive wood, but there seems to have been only enough of this for one door, as that is the only use specified; cedar, which is understood to have been the common cedar of Lebanon; and ''fir,'' which doubtless was not a fir at all, but the stone pine (Pinus pinca) which still grows in countries bordering the Mediterranean sea.

Scholars do not agree as to the precise locality where the lumber operations were carried on; but the consensus of opinion is that the mountain ranges standing back from the coast of Tyre and Sidon supplied the timber. This region lies from 120 to 150 miles north of Jerusalem. The timber, therefore, had to be transported that distance, and the region lying between those mountains and Jerusalem is to this day lacking in good roads, and doubtless there were only foot paths in the time of Solomon, although there is known to have been a road for wheels from the coast near Sidon inland to and across the mountains where the timber grew.

Transportation was a very serious problem for Solomon. He had practically no horses except what he imported from Egypt, and they were too expensive for log hauling. The cost of a horse is given, and in modern money it was equivalent to \$1,200. Therefore, human muscle was cheaper than horseflesh, and that was what Solomon used.

Hiram saw to it that he got the easy end of the lumber hauling. Solomon's workhands carried the timbers from the mountains of Lebanon to the coast (perhaps twenty or thirty miles); Hiram constructed rafts and floated them about 150 miles south along the coast, opposite Jerusalem; and Solomon's men carried the lumber overland from the coast to Jerusalem, about fifty miles. A land carriage of not more than 150 miles would have taken the lumber direct from the forest to Jerusalem; but it was decided (and wisely, no doubt) to carry it by both sea and land.

The terms of the contract are peculiar, and one is led to wonder what Solomon with all his wisdom was thinking about when he signed such a document. The reading of the terms shows that Solomon furnished all the laborers, except an indefinite number of bosses and managers which Hiram set over the workers, and even these were fed by Solomon. It is evident that Hiram charged pretty high for the expert advice which he was able to furnish. It is stated in the Jewish account of the transaction that Hiram's men were skilled lumbermen, and it is made plain that Solomon's

workmen knew nothing about cutting timber. Hiram evidently took advantage of this fact to drive a hard bargain with his kingly neighbor, Solomon.

There is something radically wrong in the accounts of the number of men engaged in the timber cutting and carrying, or in the amount of lumber delivered. The number of men is too large for the quantity of work done, after making all allowance for poor tools and primitive methods. Oriental exaggeration has plainly been at work in stating the forces at work and the time.

Solomon is said to have sent 80,000 "to hew in the mountains," and 70,000 carriers of burdens. In addition to these there were 3,600 overseers, and there seems to have been an additional levy of 30,000, working in shifts of 10,000 a month.

That was an enormous crew of lumbermen, but the figures are explicit.

The most remarkable thing in the whole matter is the total quantity of timber required to build the Temple. The amount is not stated in exact figures, but the specifications are given and it is easy to figure the amount approximately. Here are the dimensions of Solomon's Temple, reduced to English measure: Length, 100 feet; height, 50 feet; breadth, 33 feet 4 inches. In front of the Temple was a remarkable porch: note its dimensions; length 33 feet 4 inches, height 200 feet. This was the Temple. Additions and other buildings in the vicinity were afterwards built.

The Temple was of stone, but certain finishings were of wood, and here is where the lumber was used. The specifications are pretty explicit as to the number and sizes of the planks and timbers, except that thickness is usually not stated. For that reason it is not practicable to figure exactly the amount of wood used; but taking the surfaces which were covered, and assuming that the lumber was of proper thickness for such use, the total amount of lumber employed in building Solomon's Temple was between 50,000 and 60,000 feet, board measure.

That is not a very large output for 150,000 men to cut and deliver during seven years, even if it had to be delivered on men's backs over seventy odd miles of rough trails. The pine was used to ceil one room and also for flooring. The cedar made up the bulk of the lumber bill. Commentators say there is uncertainty in translating some of the technical terms made use of; but it is claimed that the beams were hung in stirrups instead of being inserted in the masonry; and it is thought this shows that the builders were trying to protect the ends of the timbers against decay.

That was the most expensive bill of lumber of which history gives any account. After making due allowance for oriental exaggeration, which is notorious, the cost was plainly out of proportion to the amount of work done, as is evident from the pinch which Solomon was in when Hiram began to push for the balance due on the contract. He had not cash to meet the bill, and Hiram generously consented to accept twenty cities of northern Palestine in payment of the balance due, and Solomon (doubtless with extreme disgust) ceded that large slice of his kingdom to settle the lumber bill.

The historians Renan and Breasted look a little behind the scenes and suggest that we have not the whole story of that lumber transaction, and that the account as we have it was doctored for political effect. According to historical evidence Solomon was not an independent king at all, but a vassal of the king of Egypt; so was Hiram. Solomon was getting too much territory for the good of the other vassal kings around him, and probably a hint came from Pharaoh of Egypt that it would be better to cede some of the northern part of Palestine to Hiram to even things up. Solomon had no choice but to comply; but the matter was explained to the public by saying that the transfer of territory to Hiram was made in payment for services rendered. Such an explanation accounts for the enormous number of workmen given in the account. The number was written large so that the ceding of twenty cities would seem to the people of that day reasonable payment. But

when cold calculation is applied to the problem it is plain that something was wrong; for 150,000 nen could not have spent several years in cutting and assembling three carloads of lumber. The

necount was doubtes as then one after the actual transaction, by some one desirons of explaining away and glossing over Solomon's poor business ability if not his political inisfortunes.

The Lightest of Native Woods

If asked to name, offhand, the lightest native wood of the United States, most persons would give the place to white pine; yet there are several that are lighter, and some of them are in common use. Sugar pine (Prous lambertions) and knobeone pine (Prous attenuata), both of California, are lighter. Some of the spruces and several of the firs weigh less. The northern white cedar (Thuja occidentelis) and southern white codar (Chamacognasis theyordes), the former growing in the northern states and the latter in the eastern, lack considerable of tipping the scales with white pine. The California bigtree, the largest in the world (Season mashematomana) is still lighter than the cedars. All the foregoing are softwoods, Some of the hardwoods are as light or lighter. Among these is the West Indies birch or gumbo limbo (Bursena simaruba), which is not a birch or closely related to that genus. It grows in southern Florida. Balm of Gilead (Populus balsamifera), of the northern states, is lighter than white pine; and the Florida golden fig (Ficus aurea) is much lighter. The Spanish bayonet (Yucca treculeana) of the Southwest and giant cactus (Cereus giganteus) of Arizona fall below white pine in weight.

No one of these is the lightest wood. The one which is clearly entitled to that honor may be found in considerable quantity in some of the swamps of Butler and Dunklin counties, Missouri. It is likewise native in the gloomy swamps which stretch inland on both sides of the Appalachicola river, near its mouth, in Florida. The same tree occurs in swamps along the Brazos river in Texas.

It is generally known as leitneria or corkwood (Leitneria floridana). It has little more than one-third of the weight of kiln-dried white pine. In addition to being the lightest wood of the United States, the tree is among the smallest. No trunk exceeding twenty feet in height has ever been reported, and the extreme diameter is four or five inches. Usual sizes are much less than this; and would ordinarily be classed as mere shrubs. It is called corkwood because fishermen among the reefs and channels along the Florida coast have long used the wood, in place of corks, to float their fish nets, and the Seminole Indians made similar use of it long before.

The tree is deciduous, that is, it sheds its leaves yearly. The leaves are smooth-edged, from four to six inches long, rather narrow. The form and general appearance of the flowers bear some resemblance to those of river birch, and they appear in Missouri in March, but earlier in Florida. The fruit is a drupe—a sort of plum—with a flat seed and with flesh utterly worthless as food for human beings, though birds pick a few of them when nothing better can be had. The drupes are about three-fourths of an inch long, and very slender. The dark gray bark is almost as thin as paper on branches and small stems, but thickens with age.

The wood is the most interesting part. It is soft, weak, and exceedingly light. A cubic foot of it weighs little more than a gallon of water. It is pale yellow in color and without trace of heartwood. The tree is of slow growth, and the annual rings are so indistinct that they can be counted only with difficulty. The wood is absolutely without figure, no matter in what way it is cut.

No use of this wood for cabinet purposes or inlay seems probable. It might be employed in the manufacture of artificial limbs, provided pieces large enough could be procured. It is not known that it has been tested for this use and it may be too weak, or possess properties disqualifying it. At any rate, it might be worth while for some one interested in the business to give it a trial, though probably one of the first discoveries would be that sizes large enough are too searce, though small stems are abundant enough in certain localities.

The tree has been known to botanists for nearly a hundred years. Its botanical name, Lecturius, commemorates the sacrifice of a valuable life in studying this species and others in the wilds of Florida. Dr. Leitner, a German botanist, lost his life there during the Seminole war.

The tree's habit of growing in deep swamps makes it a difficult subject of study. The surroundings are not congenial, and a man traveling for pleasure or recreation will never go where leitneria grows; because he must wade through water, flounder in mud, run the risk of snakes, be tormented by mosquitoes, gnats, and all manner of flying, swimming, and creeping things that swarm in swales and lagoons. Fishermen who want the wood for net floats go where it is and get it; and bird hunters with their rubber boots and flat canoes penetrate the drowned lands where the corkwood grows; but few others go there for business or pleasure.

The scientist, of course, will go anywhere within the range of possibilities in search of facts, and no tree or plant grows too high on mountains or too deep in swamps to escape the searcher after knowledge. A Chicago botanist recently secured a photograph of the leitneria, but in order to do so he was obliged to dig a tree out of the almost impenetrable jungle where the camera could not be brought to bear on it, and replant it in an open space where it could be photographed. This incident throws light on the nature of the places where the tree is at home.

It is not easy to explain how the leitneria happens to grow in so few places and so far apart. It looks like chance, and yet it is harder to explain how a thing happens by chance than to account for it by means of cause and effect. Three widely-separated points, a thousand miles from one another, are the only known places where this interesting species occurs. It is a solitary species, without a known relative on earth, except certain distant third-cousins. It is a lone family, a lone genus, a lone species; and it has attempted to separate from itself, if such a thing were possible. Some of the leitnerias have their habitat in the gloomy morasses of western Florida; some took refuge in the swamps of southern Texas; and the third remnant chose its lonesome home in the dismal lagoons of southeastern Missouri. These swamps are much alike in character: but how did the leitneria happen to be in those three swamps and nowhere else? There are many other regions with drowned lands, mud flats, bogs of mire and jungles of tangled vines and trees; but this species missed all of them, for no known reason, and established itself in three widely-separated places only, and there it lives, a weakling among its associates, for it is not able to grow high enough to reach the sunlight which is shut out by the canopy of other trees.

The German Idea

While Uncle Sam is prosecuting people for maintaining retail prices, Germany is making things warm for the price-cutting fraternity. As an instance a retailer has been brought into court for having obliterated a certain identification mark on the goods he sold, by which mark the manufacturer expected to trace price-cutters, and was found guilty and liable to heavy damages.

The defendant was found guilty on the application of the law of unfair competition, which makes liable anyone whose business acts are such as to offend good morals. He was found guilty of injuring trade of his competitors by selling below the contract price, by which they were likewise bound, and by causing damage to the manufacturer's business by giving rise to the belief that its goods could be bought at different prices at retail instead of at a uniform price.

Woods Used in Turnery

Those who are not familiar with the subject will be surprised to learn that the fore gn woods which come to this country annually are valued at about \$52,000,000, besides our own supply of about 40,000,000,000 feet, which is utilized for various purposes. Notwith-standing the extensive use of iron for construction purposes in ships and house building, there has been no diminution in our consumpton of woods, ether native or foreign. The imports during 1911 showed an increased value of over \$25,000,000 over the imports of 1906. The class of foreign hardwoods has increased considerably in consumption within the past ten years, which is an indication of the greater demand for the purpose of interior finish and furniture.

There is a special class of foreign woods which is seldom referred to in the trade papers. Reference is made here to the commercial woods of the turner, and a list of the most important kinds which come to the American markets may prove of interest to dealers, as well as to wood users.

Brazilwood (Caesalpina echinata) is the product of a leguminous tree at one time used extensively as a dye-wood. It, grows very abundantly in Central and South America and is imported chiefly from Costa Rica and Colombia. This wood is frequently shipped from Pernambuco and is now called Pernambuco wood. When first cut it is of a light color, but soon becomes darker on exposure to the air and light. The peach-wood, Nicaragua-wood, and Limawood of commerce are produced by this and several closely allied species.

Braziletto-wood is furnished by Caesalpina brasiliensis, which grows in the northern part of South America, Jamaica, and in other parts of the West Indies to the height of about twenty feet. This wood is much used for ornamental cabinet work. Both the brazil and braziletto are employed in turnery and for making violin bows.

Canary-wood is obtained from Laurus indica and Laurus canariensis, trees native of Madeira and the Canaries. These woods have the odor of sassafras and are often used in house carpentry and also for interior of boats, for inside works of drawers, boxes, etc., as their odor is supposed to repel insects. Canary wood is very durable when seasoned, remarkably tough, strong, and excellent for handles of tools generally.

Cocus or kokra are names applied to two entirely distinct woods. One is obtained from tropical America and the other from the East Indies. The tropical American wood is the green ebony (Bryaebenus) and is now principally derived from Mexico and Honduras. It is only a small tree yielding logs of about six or eight inches in diameter. The sap-wood is thin and nearly white or often yellowish, while the heart-wood is deep rich-brown mixed with green. The wood is exceedingly hard, heavy, strong, tough, and susceptible of a very high polish. It is much used for rulers and other small work. The cocus wood obtained from the East Indies is a product of several species of Albizzia lebbek, which is also called the siris tree. The wood has a handsome grain rendering it suitable for fancy work, such as paneling, carving, picture-frames, toys, combs and turnery. This tree has a very wide distribution and has been introduced into most of the islands of the West Indies.

There are several other trees which yield commercial woods called green ebony. The principal one is said to be the Excoccaria glandulosa of Jamaica, but this wood is now very rare and consequently very little used. Jacaranda mimosifolia of Brazil is often called green ebony and formerly was used for turnery and has also been used with success in dyeing, but at present is not much known.

A good many species of true ebony are known to yield in great abundance the black ebony of commerce. There are more than sixty species of the genus Diospyros and the best known kinds are those from the East Indies, i. e., D. cbenus, cordifolia, ebenaster, mabola, melanoxylon, roylci and tomentosa. The ebony derived from West Africa is commonly considered the most uniformly black. The principal species from West Africa are Diospyros crassiflora, D. dend, D. mespeliformis, D. mombuttensis, D. atropurpurea.

The kinds obtained from Mauritius and Ceylon are more or less

variegated and are often cream brown, and those from the Philippine Islands are seldom solid black.

Fustic or mora (Chlorophora tincteria) is a West Indian tree, the wood of which was formerly used extensively in cabinet work, but was found to durken and change color on exposure to the air and heat. It is still used occasionally in turnery, but its chief use is for making a dye extract. The principal imports come from Venezuela, the West Indies, Mexico, and parts of Colombia.

There are several ironwoods which have been imported from time to time in small quantities. Metrosideros verus from the East Indies rarely comes in the American markets. It is the ironwood of Chinn where it is much used for making rudders, anchors, etc., for ships and boats. Some species of Sideroxylon from southern Florida and the West Indies furnish other iron woods that are used in this country. Another close hardwood that is heavier than water, is the Argania sideroxylon of northern Africa. This wood is used in southern Europs. but does not come to this country, except in the form of small manufactured articles.

Another tree which yields wood used for making excellent furniture and fancy work is the jackwood or cos (Artocarpus integrifolia). The tree is the bread-fruit tree of the West Indies. The wood is coarse, and open-grained, though heavy, of a beautiful saffron color, and emits a peculiar but by no means an unpleasant odor.

King-wood (Dalbergia sp.), one of the most beautiful of the hard-woods imported, comes into the American markets occasionally from Brazil, in trimmed billets, from two to seven inches in diameter. It is also called violet-wood, because it is streaked in violet tints of different intensities. It is finer in the grain than true rosewood. The smaller pieces are frequently striped, and occur sometimes full of elongated zone eyes.

Letter-wood or snake-wood (Brosimum aubletii) is a scaree and costly wood of British Guiana and Brazil. It is very hard, of a beautiful brown color, with black spots. These spots are visible only in the heartwood which is seldom more than twelve or fifteen inches in circumference. It is now chiefly used for making walking sticks.

Lignum-vitae is a common, well-known, hard, heavy wood produced by several species of Guiacum found in the West Indies. It is used for a great variety of purposes requiring hardness and strength.

Nutneg-wood is a name given to the wood of the Palmyra palm (Borassus flabelliformis), which is used in turnery, and, from its mottled character, for umbrella and parasol handles, walking sticks, rulers, fancy boxes, etc.

The stems or trunks of several palms obtained in the East and West Indies are imported, to a small extent, for fancy use. They furnish a great variety of mottled, ornamental wood, black, red, brown, and speckled, and are used for cabinet and marquetry work, and for walking sticks, umbrella handles, and billiard cues. Among the most common kinds are the cocoa-nut, betel-nut, and Palmyra.

The nuts of two South American palms, the vegetable ivory nut (Phytalephas macrocarpa), and the dark coquilla nuts from Attalea funifera, are largely used by turners for small fancy articles.

Partridge-wood (Andira inermis) is a name for the wood of several trees coming from South America. It is used for waking-sticks, umbrella and parasol handles, and in cabinet-work and turnery. The colors are variously mingled, and most frequently disposed in fine hair streaks of two or three shades, which in some of the curly specimens resembles the feathers of the bird. Another closely allied kind is called pheasant-wood (Cordia gerascanthus), obtained in Jamaica, almost exclusively used for turning. Purple wood is produced by Copaifera pubiflora and C. bracteata, two trees of British Guiana, which furnish wood of great size, strength, durability, and elasticity. The color varies much in different specimens, some being of a deep red brown, but the most beautiful is of a clear reddish purple, exceedingly handsome when polished. It is used for inlaying work, marjuetry, and in turning. Some varieties are called king-wood, but they are variegated, while the true purple-wood is plain. Queen-wood is a name applied occasionally to woods of the cocus and greenheart (Nectandia, imported from Brazil. The word of Iar(s) characteristic of the West Indies, faintshes a green s coordinates.

Red sanders is a hard, heavy East Indian wood, obtained from the Ptercearjus santalinus, imported from Madras and Calcutta, chiefly as a dye-wood. It takes a beautiful pol-sh, and somewhat resembles brazil-wood.

Rosewood is a term as generally applied to a great variety of trees growing in different countries; so called sometimes from the color, and sometimes from the smell of the wood. The rosewood imported in such large quantities from Brazil is obtained chiefly from the Jacana da botasima, and some other species. The Physicalgronal scaberrium from Brazil, is said to furnish one of the rosewoods of commerce. It is the "Pao do rosal" of the Portuguese, and the tullip-wood of the English. The great bulk of true rosewoods goes to France and Germany. A rosewood is obtained in Central America and Honduras, from a species of Amyris and another from Dalbergia and migra. East Indian rosewood, a valuable mottled black timber, is obtained from Dalbergia latifolia and D. sissoids s: these furnish the

well known Malabar blackwood, which is heavy and close grained, admitting of a fine polysh. The best curved furniture in East Indies is made from this wood. A similar kind of rosewood is obtained on the west coast of the Gulf of Siam, but the grain is not so close as the South American wood. Large quantities are exported annually from Bangkok to Shanghai, and other parts of China.

The East Indian satinwood is the product of Chlororylon swietema. It is a close grained, hard, and durable wood of a light orange color, and when polished has a beautiful satiny appearance which it loses by age, unless protected by a coat of fine varnish. This tree occurs abundantly in the northern parts of Ceylon, "flowered satin," but the variety known, on account of the pattern, is scarce.

The West Indian satinwood is obtained from Simaruba tulac, in the Bahamas, and from several species of Fagara. The wood of the European Yew (Taxus baccata), being hard, compact, and of a very fine, close grain is occasionally used for fine cabinet work, or inlaying, and by turners for making jewelry boxes and musical instruments. The wood taken from parts near the root are often very beautiful.

Northern Michigan Hardwoods

The following is a summary of an article which recently appeared in the Intestor of Detroit, Mich. Many persons will be agreeably surprised that so great timber resources remain in a region which has been for a long time accessible by both rail and water transportation. Notwithstanding lumbering on an extensive scale has been carried on in the copper country of northern Michigan for fully half a century, it is conservatively estimated that there is now standing in Houghton and Keweenaw counties saw timber whose value on the stump exceeds \$17,000,000. This estimate does not include millions of cords of cordwood, pulpwood, cedar poles nor lagging, of which there is a large amount in these two counties, and whose value would easily run into the hundreds of thousands. Nor is there included \$0,000 acres of timberland, containing probably 750,000,000 feet of commercial timber, which is held by corporations which do not offer the stumpage for sale.

It is estimated that the timberlands of the copper country will cut about 9,000 feet to the acre. In Kewcenaw county, exclusive of holdings reserved from the market, there are 91,000 acres of wooded lands, running approximately 819,000,000 feet of saw timber, while in Houghton county there is an area of about 384,790 acres of standing timber, which will approximate 3,463,110,000 feet, or a total of 4,282,110,000 for the two counties.

These extensive stands of timber are accounted for by the fact that the pioneer lumberman cared for nothing but pine. Other woods of equal value were ignored, and the monarch of the northern forest alone fell before the initial onslaught of the lumberjack. As a result, the copper country today boasts of the largest and finest belt of hardwood timber to be found in the Middle West. In Keweenaw county, especially toward the east coast, there is a large amount of oak, which is now being bought in by Wisconsin furniture industries. The oak is not so plentiful in Houghton county, but the timber runs heavily to basswood, birch of every known variety and elm. In both of these counties hard maple predominates. The trees reach an unusual height and girth, thanks to the unconscious foresting of the pine-cutters, and the finest quality of flooring is now being manufactured from this northern maple.

Birds-eye maple, while not abundant, is encountered more frequently than in any other timber belt in this section of the county.

It is of prime quality, and is selling on the stump for as high as \$50 the thousand. It is much in demand among the veneermakers, and large quantities have been purchased within the past two years for export trade.

The basswood has been used freely by the mining companies for the brake-shoes on the huge drums upon which the cables used for hoisting are coiled and uncoiled. It is also sought by wood-dish manufacturers and the producers of excelsior and wood-wool. For this latter purpose, however, a preference is now being expressed for poplar, which is one of the copper country's commonest and cheapest woods.

The peculiar geographical position of this region renders it an ideal site for lumbering operations. The peninsula is criss-crossed by numerous railroad lines, and when a railroad is not convenient, there is always Lake Superior, Portage lake, Torch lake or the network of government canals which thread the peninsula. There never has been experienced any difficulty in getting timber to market.

Attracted by the unique advantages offered by the copper country as a manufacturing center, a dozen wood-working industries are now headed for the land of the red metal. These plants embrace practically every department of the industry and are coming from as far south as Maryland and from as far west as Colorado. A majority of the plants which will make Copperdom their home are now located in the lower peninsula, and their attention has been attracted by the activities of the Copper Country Commercial Club, whose operations cover the entire peninsula, and which is located at Houghton.

Quacks in Tree Surgery

The quacks who administer worthless or injurious nostrums to human beings are not wholly alone. The new science called "tree surgery" has been abused by quacks for a long time, and abuses may be expected to increase and multiply in the future as the popularity of the new surgery grows. One of the treatments consists in administering iron tonic to a sick tree and thereby rebuild and tone up its health. The treatment is so simple that its exact nature must be concealed, or the owner of the tree will attend to it himself rather than fee a surgeon for doing it. The regulation dose consists of a half dozen nails, and the instrument for administering is an ordinary hammer. The nails are driven into the tree's roots, or into the trunk as close to the ground as possible. The theory is that the tree's sap that comes in contact with the nails is oxidized and is transfused through all parts of the trunk, branches, and leaves, thereby effecting a cure of whatever disease the tree may have. There is no question that iron rust is carried some distance from the point where the nails are driven in the bole: but it is not apparent what benefit accrues to the tree. It is said that fatal results follow if copper nails are substituted for iron. It is claimed that the tree will die the following year. The argument is, therefore, that none except a skilled tree doctor should practice this surgery, because a mistake in the metal used may prove as disastrous as a mistake in certain kinds of human medicine.

The Uses of Aspen or Popple

Minnesota has a million acres of aspen or popple, and the state forest service has commenced a campaign to place this wood in the class of useful forest materials, where it belongs. For the past five months E. O. Buhler has been carrying on investigations with that object in view.

It has resolved itself into a question of education. The wood is all right, but the people generally, and particularly the settlers in northern Minnesota, do not know it. They formerly looked on it as a muisance. It was in the way. They had to cut it and burn it when they cleared land. No one thought of selling it, because no buyers ever made inquiries concerning it.

The need for the utilization of a cheaper wood is seen at a glance when the rise in the price of white pine is considered. Thirty years ago white pine land in Minnesota sold for \$2.50 per acre. There was approximately 25,000 board feet per acre. This made the price of stumpage about 10 cents per 1,000 feet. Twenty years ago the price had risen to \$1 per 1,000 feet. Last year the price received at state sales was \$9 per 1,000 feet. A rise from 10 cents to \$9 per 1,000 feet within thirty years.

The same story can be told with regard to Norway pine. Ten years ago a homesteader would not settle on land that was covered with Norway pine. Last year at the state sales in Minnesota the price for Norway pine was about \$8 per 1,000 feet.

What is true of white pine and Norway is also true of tamarack, cedar, spruce, hemlock, southern gum and cypress.

While the price was rising rapidly for all these other woods, there remained unused in Minnesota millions of feet of popple, or aspen. It averages about 2,000 feet per acre, making a grand total of about 2,000,000,000 board feet in the state. Much of it is in the northwestern part of the state.

Aspen is a widely-dispersed species. The light seeds are carried long distances by the wind, and burnt tracts are seeded with young growth. The trees grow rapidly, but they do not attain great age. The aspen has been called the ''sudden sawlog'' tree, because it so quickly attains full growth. It is not a large tree, however. Pole sizes are usual, and timber larger than that is uncommon.

Enormous areas are coming on. Seedlings are taking possession of cutover land as well as of burnt tracts, and the years to come will see a large quantity of this timber ready for market.

The question which is now being discussed in Minnesota is, What shall be done with this timber? Other states and regions have partly solved the problem. The cutters of pulpwood take hundreds of thousands of cords annually for use in the manufacture of paper. It is white, with good fiber, and is valuable for pulp. The mills pay seven or eight dollars a cord for it, delivered at the place where it is wanted.

The wood has many other uses in different regions. New England manufacturers convert it into the following commodities: Basket bottoms, hoops, boxes, brush backs, buckets, pails and tubs, window cases, ceiling, crates, excelsior, handles for dippers, knives, and ladles; spools and spool heads, toys, parts of wheelbarrows, and children's sleds. Many of the same uses are reported for the wood in New York and some in addition. It is used for ladders, casket boxes, parts of organs, and refrigerators. In Michigan the wood is employed in making dishes, fish kits, jelly buckets, lard pails, putty kegs, spice kegs, and sugar buckets. In Minnesota some flooring has been made of aspen, and it has likewise been reported for siding. Its other uses in Minnesota are much the same as those in Michigan.

These uses are wide enough in their range to show that the wood has value. The chief limit to its usefulness is on account of the small size of the trees. It is strong enough for many purposes. Geographically, it is a northern species, but its range extends down to Pennsylvania, Missouri, New Mexico and Arizona. It is difficult to state what the annual output is, because when sawmills cut it they may call it cottonwood, or poplar, or aspen, or perhaps balm

of Gilead, though the tree itself is not likely to be mistaken for the latter.

If the time ever comes in the northern country when trees are planted on vacant tracts, little expense need be incurred to seed the ground with aspen. Seeds may be blown for miles away, and usually a bared surface will receive enough to stock it fully. The common cottonwood overlaps the aspen's range in the North, but usually the former loses its importance and gradually gives way to aspen as the cold regions are reached. The largetooth aspen is often mistaken for the smaller species, and the woods of the two closely resemble each other. They occupy the same range in part.

Bethabara an Excellent Timber Tree

Bethabara is a copyrighted name applied to a British Guiana wood now imported into the United States chiefly for making fishing rods for which it is said to have no equal. In the region where it grows the Indians call it wasiba or washiba, and the English speaking people have given it the name of bow wood, because the Indians use this wood more than any other for making their bows. The wood was given the name bethabara by a New York dealer in order not to make known where it originated which enabled him to monopolize the trade. It was at one time reported to come from West Africa, but it is now generally known among users of this wood that it is obtained from a rare and little-known tree, which grows along the banks of the Issoroora Creek and Pomeroon river in British Guiana. Its exact distribution is not known, but it is quite likely that the tree grows also in parts of Venezuela, Brazil and in Dutch and French Guiana. It is said to attain a height of from eighty to one hundred and twenty feet and a diameter of from three to four feet. It has a clear cylindrical bole for twenty or thirty feet.

The wood is light olive-colored after it is exposed to the light and air, but on a freshly cut surface it is of a yellowish-green color which is due to the contents of the pores in the wood. These pores are filled with a substance known as tylosis which is of an orange color turning darker with age. These tyloses which are gummy are so abundant that they adhere to the edge of tools and produce an effect similar to dullness. The edge of tools must be frequently cleaned by means of a whet-stone or by washing it in a weak solution of sodium hydroxide. The wood is exceedingly hard, heavy (about seventy-six pounds per cubic foot), tough, elastic, and works with difficulty. It is exceedingly durable in contact with the soil and is frequently employed in British Guiana for fence posts, telegraph poles, and for the foundation of houses. It is used wherever great strength, hardness, and durability are required. Bethabara is frequently believed to be related to greenheart (Nectandra rodiaei), since these two woods have nearly similar physical qualities, but this is not the case. Bethabara is an undescribed species of Tecoma and a member of the catalpa family, while the greenheart belongs to the laurel family of plants. There is another wood in the market known as niob which is similar to the bethabara though it is considered by some to be the tonga or tonguin (Dipteryx odorata) which belongs to the pea family. The uses of bethabara is this country are not numerous. It is now being imported only in small quantities and practically all of this material is consumed by the fishing-rod makers. It is used occasionally for making walking sticks and umbrella handles.

President Barnaby and Secretary Fish of the National Hardwood Lumber Association have just returned from Buffalo, N. Y., where they were in conference with committee of Buffalo lumbermen having charge of local arrangements for the seventeenth annual convention, June 18-19th. After going over the ground carefully, the Hotel Statler was selected as convention headquarters. The Statler is a new and modern hostelry, provided with ample assembly hall and otherwise having the capacity, equipment and service for taking the best of care of a full-fledged convention.

Furniture Factory Short-Cuts

The further manufacturers and consciners of dimension stock go with the proposition, the more name tools do its advantages become. The general, basic arguments in favor of using humber out to size have long been familiar to the trade; but the detailed benefits appear only with actual trial of the proposition.

Experience is beginning to accumulate, and the results are the more impressive by reason of the improvements brought about, from every angle. In a word, dimension stock has not only made good, but it has made good in more ways than it had been expected to do, and the latter features furnish a strong argument in favor of the more general use of the plan.

For example, it was pointed out not long ago that consumers are insisting more than ever before on carrying small stocks, and on getting just enough lumber to insure a sufficient supply at all times. The dimension stock plan fits into this mode of operation as though designed for it, and the experience of a number of furniture factories in this connection is enlightening.

When ordinary lumber is purchased, it is necessary to kiln-dry ft, of course, before putting it through the factory. It is next to impossible to arrange receipts of lumber on so exact a schedule to keep the kiln filled, and to insure an ample supply of dry lumber constantly being available. The result is that whether the consumer wants to or not, he is compelled to carry a surplus of considerable extent, and the rehandling of this lumber, from the car to the yard and from the yard to the kiln, is an added expense which an ideal operation of the system would get away from.

This is accomplished by means of the dimension system. The manufacturer of lumber cut to size kiln-dries his lumber before cutting it up, and as a matter of course keeps a considerable quantity of dry stock on hand. When he gets an order for dimension lumber, all that is necessary is to cut the stock to size and ship. Thus the consumer is nearer to his supply of material by the length of time required to dry under ordinary conditions, and is consequently that much better off when it comes to planning his purchases and arranging his manufacturing operations.

In fact, experience has shown that the plan of having a steady supply of lumber move from the manufacturer to the factory consumer can be handled more conveniently when dimension lumber is used than when ordinary stock is shipped. If the plan of the consumer has been to carry a considerable stock of lumber, and have enough kiln-dried stock on hand to keep the machine-room supplied at all times, the use of the facilities of the lumberman enables him to reduce his investment in stock and to have shipments made against his actual requirements and not against his future needs.

In this connection another advantage has been discovered. The manufacturer who heretofore has carried a considerable amount of lumber on his yard, in order to have plenty of stock ready for the kiln, or who has had a good deal of money tied up in dry stock, awaiting the needs of the cutting department, is now able to take the same money, put it into dimension stock, and be ready to surface the material and send it to the cabinet-room at a moment's notice.

In other words, the furniture manufacturer has heretofore been "up against it" on the matter of deliveries, in a good many cases, because of the difficulty of getting out special lots in less than sixty days. In fact, many furniture men assert that it is impossible to do justice to the work and put a piece of furniture through, from the kiln to the car door, in less than two months.

The peculiar trade conditions in this business emphasize the disadvantage of not being able to ship quickly. Usually the retailer does not order until the last minute, and when he wants a piece of furniture or a carload of it, he usually wants it in a hurry to take care of demand which is developing at that time. Delay in getting the goods to him is frequently fatal, and interferes with the success of the manufacturer. But since he is not in a position to anticipate the demand, except in the case of staples

which can be depended upon, he is compelled to wait for orders, and then must rush in order to get them out in time for use by the retailer.

That makes the big advantage of being several important steps in advance of the usual procedure all the more desirable. If instead of putting the lumber through the kiln and then having it cut to size in his own machine-room, he can take the dimension lumber from stock, where it was carried for just such an emergency, he can save from three to four weeks in getting out the goods. And that much time is often the difference between holding a customer by good service and losing him because of slow deliveries,

The flour miller seldom carries the finished goods in stock. The chief reason is that flour values are much greater than wheat, and interest, insurance and other carrying charges mount up too high to make it profitable or practicable to have a very large supply of flour ahead. But the miller does carry wheat in stock—all he can afford to buy when the market is right. He wants to have his material where he can get it at short notice, and in such shape that he will not be delayed in beginning the important work of converting grain into flour.

The furniture manufacturers have learned that they can play the same sort of game in connection with dimension stock. Instead of manufacturing their furniture complete, and carrying it in stock, a procedure which is difficult and dangerous, from the standpoint of policy, because of the absence of exact knowledge on the subject of demand, they work up their raw material as far as possible, under the restrictions necessarily imposed, and are thus ready, at any time the demand for a given item develops, to begin its manufacture at a point much further along than would ordinarily be the case. Even in the case of numbers which are doubtful sellers, standard parts can be provided, so that only the odd items need to be made up when the order comes in.

"We make a wide and constantly changing range of styles," said a furniture man not long ago, "but we have found it to be a considerable advantage to put in a big stock of standard parts, such as legs, tops, etc. We order these for practically the entire season's requirements, as we see them, and then specify deliveries from time to time in sufficient quantity to give us a big stock of this material. The process of manufacturing, when orders are received, is considerably shortened. We have much of the material, even on the numbers regarding the demand for which we are not certain, already made up, and the work of getting it out is therefore greatly expedited. This, we believe, is one of the greatest advantages of using dimension stock, from the standpoint of the consumer."

A point which dimension men have been quick to take note of is that the cost of handling a great number of small pieces is much larger than the expense involved in taking care of the same footage of lumber of standard lengths. Consequently, in order to meet this objection, furniture material is now shipped in bundles, secured with wire, so that a car can be unloaded quickly and economically.

In the same connection it is worth noting that the dimension men are performing a service not unlike that of the veneer manufacturers, some of whom match and tape veneers so that they are ready to lay when received at the factory. That is, in many cases the dimension manufacturer matches up lumber that is to be joined, rips it to size and keeps the various pieces together in the bundle, so that each top is a unit, and the consumer is assured of having uniformity as to color and figure. This is a real service to the factory man, who ordinarily makes many blunders in setting out solid tops through being unable to secure uniformity in these respects.

These and many other practical advantages, which are developed only by actual operation of the system, have served to win many permanent customers for dimension stock manufacturers, and to increase the business of those mills which provide the right kind of service regarding such things as matching up, inspection, etc.

Red Gum as Door Material

A man need not be very old to remember when red gain was not used by the manufacturers of doors in this country. Perhaps a chance one might have been made here and there a good many years ago, but such escaped the notice of the public, and no general attention was paid to them.

A good door is not one of the easy things to make. It is a pretty severe test of the qualities of wood. A door can be put together without much trouble, but to make it hold its shape is another matter, and it was a long time before manufacturers could be persuaded that red gum was worth trying out. They thought

they knew that it would prove a failure, and did not care to experiment with it. The wood had a bad reputation for warping. It was said to season slowly and with difficulty, and door makers were so conservative that they preferred to stick to the tried woods which they had always used, such as pine and spruce, with an occasional venture into the hardwood field, in which case oak, vellow poplar, and black walnut offered a pretty wide range of materials to pick from, leaving no particular reason why red gum should be selected.

The beauty of this wood was admitted long before its other good qualities were recognized; but beauty alone was not sufficient to win a trial. Few uses test the standing qualities of a wood more surely than a door. The two sides are frequently subjected to widely different temperatures. One side may face a hot, dry room, the other a damp, cold one, or may even face outdoor conditions, as when the door opens on a porch.

In such cases it is needless to say that the material of which the door is made is severely tested. It may roast on one side and freeze on the other,

or one side will be extremely dry, while the other may be in more or less contact with fog and rain. Then, if ever, may warping be expected to take place.

The solid door is unusual now, unless made wholly of softwood. It is built up. The frame is of three or more layers. The inside is called the core or the backing; the finishing woods are glued on this. The core may be of a cheap material, but it must be selected with care as to its standing qualities. It must be a wood which is not inclined to warp. Chestnut and white pine are among the best core woods, but there are others. Next comes the cross-banding, the grain of which runs opposite to that of the core. The veneer which is glued over the cross-banding is generally selected on account of its good appearance. It is the visible part, and the beauty of the door depends largely upon the color, figure, and grain of the veneer.

Other qualities, however, are demanded. Beauty of color and figure are highly desirable, but they amount to little unless the outer veneer remains where it is placed. If it pulls loose and peels off the door is ruined. For that reason the woods which

go into such doors must possess good gluing properties. The glue must take hold and stick. It must do this during trying times and weather changes as well as when everything is lovely. It is here that red gum has its inning. It holds glue, provided the glue is right and is put on right; but the job must not be slighted. Gum is a poor wood to fool with but a good one to work with. It is a material for the master mechanic to handle, not for the amateur to experiment with.

The extent to which red gum is now employed by manufacturers of doors will supprise most persons who can remember when it

was scarcely used at all for this purpose. Statistics are by no means complete, but figures have been compiled for sixteen states, and are given below. It should be explained, however, that the figures represent sash and blinds as well as doors. The statistics were compiled that way and it is not practicable to separate doors from the two other commodities. However, the quality worked into doors much exceeds the other, and makes an excellent showing. The figures represent the output in the respective states in one year.

YEARLY USE OF RED GUM FOR

DOORS.	
STATE FT. BOARD ?	
New York	3,494,000
Illinois 3	3,634,000
Missouri 1	,176,000
Ohio 1	1,006,000
Texas	814,000
Arkansas	808,000
Iowa	724,000
Louisiana	550,000
Alabama	382,000
Michigan	346,000
Kentucky	310,000
Virginia	130,000
South Carolina	110,000
North Carolina	56,000
New Hampshire	27,000
Mississippi	2,000
The same in second a black la	3:00

There is remarkable difference in the quantity of gum demanded by door makers in different states. In Mississippi, where the tree grows to per-

SEVERE TEST FOR A GUM DOOR—A SUNNY WINDOW AND A STEAM RADIATOR ON ONE SIDE, AND A LARGE ENTRANCE DOOR ON THE OTHER. AFTER A YEAR IT IS STILL AS GOOD AS NEW.

fection and in large quantities, its use is almost nil; while in New York, where it does not grow, its use runs high in the millions. The contrast is partly explained by the fact that Mississippi produces few doors of any kind, and New York turns out millions of all kinds. Even New Hampshire, with abundance of good door material of its own, uses thirteen times as much gum as Mississippi.

It might be supposed that Illinois, which lies in proximity to the gum supply, would use more of it in its door factories than New York, but for some reason it uses only one-sixth as much; and as far as available statistics show, Illinois is the next largest user after New York.

An examination of the accompanying table will at least make clear the fact that the employment of red gum in the manufacture of doors is not evenly distributed over the country. It goes in spots, and no one of the states which use more than a million feet a year, except Missouri, grows gum in commercial quantities. It is a southern wood, but the largest demand for it, by door makers, comes from the North. Texas does not use so much as Ohio, nor Louisiana so much as Michigan. It illustrates the old saying that

a prophet is not without honor except in his own country.

Doubtless a considerable number of the guin doors put on the market in the course of a year are not sold under their true name. The wood is finished in imitation of others, among which are cherry, mahogany, walnut, and oak. It is stained, grained, or printed in a way to resemble closely the wood which it passes for. A southern factory owner stated the facts profity well when he said: "We

bring nothing but red gum into the shop and send nothing but onk out."

Imitation doors made of gum may be expected to decrease in use, while the genuine article grows in popularity. The wood takes such handsome finish that there is little excuse for palming it off as something else. It is able to stand on its own merits and to build a reputation of its own.

Southern Wood-Using Industries

The South is a land of opportunities for industries engaged in manufacturing rough lumber into finished commodities. Development along that line is progressing rapidly from Maryland to Texas. Raw material is plentiful, labor is reasonably cheap, transportation facilities are good. This is a combination which inevitably leads to development. The almost total absence of statistics until recently has made comparisons with former periods difficult or impossible; but the fact is apparent that rapid, healthful growth of wood-using industries in the South is widespread.

The government has been publishing a series of reports, state by state, dealing with the amount of wood manufactured yearly into finished commodities, such as furniture, flooring, vehicles, boats, machinery, and many others. Many interesting and highly significant facts are shown by the published statistics. The figures point unmistakably to remarkable growth in wood-using industries in the South. The manufacturing considered in those reports is not the production of rough lumber at the saw mills, but that which passes through shops and factories to be prepared for the ultimate consumer.

A very good summary for most of the states is contained in the Ohio report which was recently published. Figures are there brought together which before were accessible only in scattered and individual reports. It is ascertained that the annual demand for wood by factories located in the southern states reaches the vast total of between nine and ten billion feet. The items, state by state, which make up this total, are set forth in the following list of sixteen states, each one of which is credited with what it uses in the course of a year.

WOOD USED YEARLY BY SUTHERN FACTORIES.

	reet, B.M.
Arkansas	1,361,000,000
Louisiana	1,355,000,000
Virginia	895,000,000
Texas	762,000,000
Alabama	727,000,000
North Carolina	676,000,000
Mississippi	618,000,000
Georgia	555,000,000
Florida	521,000,000
Missouri	443,000,000
South Carolina	424,000,000
Tennessee	414,000,000
Kentucky	410,000,000
Maryland	284,000,000
West Virginia	260,000,000
Oklahoma	28,000,000
Total	9,643,000,000

These figures include dressed flooring, ceiling, and siding and general planing mill products, and these account for the very large output of manufactured forest products in Arkansas and Louisiana.

For the purpose of comparison, it is proper to give the annual sammill output of rough lumber in those states. The figures are for the year 1911, as that period corresponds very nearly with the manufacturing statistics given above. It is apparent that the sammills supply abundance of raw material for the factories which turn out finished products.

State.	Cut, Feet.
Louisiana	3,566,456,000
Mississippi	2,041,615,000
North Carolina	$\dots 1,798,724,000$

Arkansas	 	1,777,303,000
Texas .		1,681,080,000
West Virginia		1.387.786.000
Virginia		1,359,790,000
Alabama		1.226.212.000
Florida		983.824.000
Tennessee		
Georgia		801.611.000
Kentucky		632.415.000
South Carolina		584.872.000
Missouri		115.550 000
Maryland		144,078,000
Oklahoma		

It appears that approximately fifty per cent of the rough lumber sawed in the South is further manufactured in the South before being sent to market. That is a low percentage compared with some of the northern and eastern states where manufacturing has long been highly developed. For instance, Michigan further manufactures eighty-seven per cent of the rough lumber turned out by its saw mills. Massachusetts manufactures twice as much as its sawmills cut, and of course much must be brought in from the outside. Ohio manufactures more than twice what its mills saw, and New York between three and four times as much as its forests produce.

What those old manufacturing states are doing in the way of manufacturing may be accepted as a prophecy of what the South will do when it has made further progress in development. It is rising rapidly to that position. The progress is apparent all over the South, but of course development is more active in some sections than in others.

Take as a concrete example the manufacture of furniture in North Carolina. That state, like all other southern states, is rich in timber resources, and it has become rich in manufactures also. It is not generally known that more furniture is made in North Carolina than in any other state, either north or south. Its closest competitor is Illinois, which uses annually 128,861,930 feet of lumber in manufacturing furniture. New York is a little below Illinois, and uses 126,064,292 feet yearly; but North Carolina uses 182,861,250 feet.

A fact which is somewhat significant is shown by a comparison of southern with northern furniture factories. At least, it is so shown if North Carolina is considered a typical southern state and New York is taken as typical of the North. The southern furniture factory is much larger than that of the North. The average yearly consumption of the wood by the North Carolina factories is 2,438,147 feet, while in New York the average consumption is 555,349 feet. The southern factory thus appears to be four times as large as the northern.

This indicates large opportunities in wood-manufacturing in the South. Capitalists are seeing the opportunities and are taking advantage of them. These opportunities consist of abundance of raw material in the form of standing timber, both hardwoods and soft; access to good markets, both at home and abroad; and plenty of reliable labor at fair prices. These constitute a combination of circumstances which have already produced results, and promise even greater for the future.

These opportunities stand close inspection. Take the timber to begin with. Everybody familiar with the southern states knows that the region has great forest resources. The timber stretches from Maryland to Texas, and from the Ohio river to the Gulf; but a

mere estimate by so many square miles is rather vague. Fortunately it is possible to be more explicit. The Bureau of Corporations has collected masses of statistics dealing with southern timber; and while these figures may not be wholly accurate in every essential, they are worthy of careful consideration. They are the best to be had at this time, and those who have criticized them have done so by declaring that the figures are too small rather than too large.

HARDWOODS

Taking into account only the sixteen states listed above, and summarizing the elaborate statistics representing their stands of merchantable timber, it is found that their hardwoods total only a little short of three hundred billion feet, which is about seventy-five per cent of the estimated hardwood stand for the whole United States. The items follow:

		Fret.
Oak		152,939,000,000
Gum .		46,443,000,000
Hickory		14,971,000,000
Ash		9,926,000,000
Miscellaneous		73,173,000,000
Total		297,452,000,000

SOFTWOODS

The hardwoods are only one of the forest resources of the South, and constitute less than half of the total timber supply. There are half a dozen kinds of pine, but they are grouped, for brevity's sake, under two heads, longleaf and shortleaf. It is not necessary to be more explicit in the present instance. Cypress is the only other important softwood. Of course, there is much cedar in some localities, and considerable hemlock and spruce, but they are omitted, and the softwood resources appear as follows:

	Feet.
Longleaf pine	232,300,000,000
Shortleaf pine	152,100,000,000
Cypress	40,400,000,000
i i	

The whole commercial stand of timber in the South, including

softwoods and hardwoods, amounts to 722,252,000,000 feet.

This is enough to last nearly forty years at the present rate of cutting in the South, though that rate is enormous; and in the next forty years a lot of young timber, not counted in the above total, will be ready for the ax. It is therefore evident that the investor in southern factories which use wood has a long time in which to operate his mills. Factories might use twice as much as they are now using without necessitating any increase in the sawmill output, provided the southern lumber were used in southern factories only. However, there will always be trade in rough lumber between the South and the rest of the country and with, the world.

The South is particularly fortunate in its accessibility to the best markets. Manufacturers naturally scrutinize that phase of the situation very carefully. Railroads thread the country in all directions. They connect with the West, North, and East, while in the direction of the coast there are numerous roads with one terminus at the harbors and the other far in the interior. Shipping facilities by land and sea are unexcelled. The land routes lead to all parts of North America, including Mexico which will become a good buyer sometime. The sea routes connect with every scaport of earth where there is any trade, either present or prospective, worth going after.

Industrial conditions in the South are favorable. Investors doubtless give much weight to that factor in planning for the future. It is not a factory population like much of that in the North is, but it is competent and capable, and training will come naturally.

Other economic considerations favor the development of the South's forest resources. One of these is the advantage of having the factory close to the raw material. This advantage holds with nearly all classes of manufacturing, but especially in converting the rough material of the forest into finished commodities. Fortunately, the woodusing factory can go to the forest. The steel mill cannot always go to the iron mine. The closer the factory is to the woods whence comes the raw material, the less will be the waste, the smaller the amount of useless hauling, the less the profitless handling of what is

unsalable. The old-time sawmill took the best logs and left the rest. It had to do it, because the poor stuff could not be sold. The modern factory, if sufficiently near the timber tract, can make nearly a clean sweep, because diversified manufacturing calls for sizes and shapes which could not be profitably moved to a distant factory. It is poor policy to haul waste stuff far. To avoid that, the factories get closer and closer to the woods. That is why they are springing up all over the South.

Car Statistics

Regular report of the American Railway Association, dated March 15, shows surpluses and shortages on that date as compared with previous dates.

On March 15, 1914, there was a surplus throughout the country of 102,010 cars. The surplus on March 1 was 159,480 cars. March 15, 1913, the surplus was but 57,998 cars.

On March 15, 1914, there was a total shortage throughout the country of 7,145 cars as against a shortage on March 1 of 5,573 cars. Shortage on March 15, 1913, was 20,223 cars.

Thus it is seen that while as compared with conditions a year ago the activity of shipments for the first two weeks in March of this year was disappointing, there seems a slightly increased activity since the first of the month. This is shown in the reduced surpluses and the increased shortages.

The Manufacture of Excelsion

Approximately a quarter of a million tons of excelsior are made every year in the United States. Expressed in board feet, the material consumed is equivalent to about sixty million feet of lumber. In this country the manufacture of excelsior does not proceed beyond the point of converting the wood into material suitable for packing glass and metal ware, eggs, flowers, perfumery and similar purposes, for filling cheap mattresses, for cheap upholstery and for filtering. In foreign countries, however, they go further and include a number of uses that are not attempted here. For instance, excelsior rope is sometimes woven, while by the use of vari-colored dyes, fancy packing and material for window displays are made, particularly for the Easter and Christmas holidays. Excelsior of special grade is also employed to some extent for surgical dressings, and flesh bruises.

The principal requirements of a wood for excelsior manufacture are softness, straightness of grain, freedom from knots, good fibre, and ability to work well under the knife. The broadleaf species represented by poplar, basswood, whitewood or tulip and willow are the best. In the South and Middle West, considerable quantities of pine are used for this purpose, but the product is not of the highest grade. In Europe the principal excelsior woods are fir and spruce, but their product does not rank as high in resilience and toughness as that of the broadleaf trees mentioned.

There are several grades of excelsior, the finest and softest being known as wood wool. The strands or filaments composing this grade are very narrow, and this can be made from only the best material. In the medium and coarser grades, the filaments are thicker and range in width from one-sixteenth to one-thirty-second of an inch. For special purposes the filaments are sometimes made as wide as one-third inch.

Excelsior wood should be reasonably straight and free from large knots. It is usually sawed into lengths of four and one-half feet and peeled. The smallest diameter advantageous to use is four inches, since the excelsior knife is from five and a half to six inches wide, and the use of small sticks materially reduces its cutting capacity. At the mill, each of these longer bolts is sawed into three blocks a foot and a half long, ready for the machines.

The machines for making excelsior vary in design from an upright form taking one or two blocks at a time, to an eight knife horizontal machine taking as many blocks. The latter type is used largely in the South. The output of these machines depends upon the kind and condition of the wood. The capacity of an upright type under the best conditions is about eight hundred pounds of medium grade excelsior in ten hours for each knife.

The Mail Bag

VIOLOGICA STORES AND SERVICE STORES AND SERVICES OF SE

Any reader of MARDWOOD RECORD desiring to communicate with any of the inquirers listed in this section can have the addresses on written request to the Mail Bag Department, HARD-WOOD RECORD, 537 South Dearborn Street, Chicago, and referring to the number at the head of each letter and enclosing a self-addressed stamped envolepe.

B 690-Has Cherry to Offer

Grand Rapids, Mida, Mar. 11.— bditor Hydrovon Ricome. Can you refer us to anyone who uses 3.4 No. 2 common decryy). We believe that this kind of wood is asod quite a good deal for the wooden portion of engraving cuts and work of that cases.

Any information you can gave us on this point will be very acceptable

The above concern has been referred; to a concern which uses a large quantity of cherry for the purpose mentioned, manufacturing it up into blocks 12x24" in size. Any consumer looking for a source of supply for this material may have the address upon application.—Editors.

B 691-Process for Felling Trees

East Pittsburgh, Pa., Mar. ! Easter Hyanwood Rice an Within the last two years we recall having seen in one of the lumber trade papers, a method of felling trees in Germany, which was a process accomplished by friction wire. If you are familiar with the process, we would be pleased to have you advise the date of the issue of your publication showing the same.

This party has been advised that there have been sundry newspaper paragraphs printed during several years covering the alleged system of felling trees in Germany by the employment of a friction wire, but that as far as we know this process has never been worked out to a satisfactory commercial conclusion. It is certain this equipment has never been offered for sale.—Editor.

B 692-Wants Gum Veneer

Utica, N. Y., Mar. 13. Editor Hyrowood Recone: Will you please give as the names of manufacturers of "\sqrt{"} gum or hardwood veneer?

The names of producers of veneers as sought have been given our correspondent. Anyone wishing his address can have it by writing this office.—Editor.

B 693-In Market for Drag Saw

Danville, Ky., Mar. 11.—Editor Harnwood Record. Will you kindly advise us who make drag saws for sawing-off logs, and if you know of a band drag saw?

Drag saws are manufactured by nearly all the sawmill machinery makers. There is no such thing as a ''band'' drag saw. Ou: Kentucky inquirer has been referred to a concern manufacturing a band log cut-off saw.—EDITOR.

B 694-Wants Soft White Pine

Butter, Ind., Feb. 23.—Editor Hardwood Recond: We would be glad if you would tell us where we can get a list of the mills selling soft white pine.

Although pine is entirely out of our field, a list of manufacturers of white pine has been supplied the above.—Editor.

B 695-Looking for Timberlands

Richmond, Ind., Mar. 11. Editor Hardwood Record: We are looking for a list of land timber and sawmill owners in the cities of Arkansas, Kentucky, Michigan, Minnesota, Mississippi, Pennsylvania, Tennessee, West Virginia and Wisconsin, and if you have anything of this sort to offer, would appreciate receiving a proposition from you at the earliest possible moment. What we are trying to do is to get at the owner of rough timber in order that we might buy it direct instead of through wholesalers and jobbers.

We would be interested to know if your lists would include in addition to the full name and address, the different kinds of lumber cut.

This inquiry is from a piano manufacturer who has been advised that such a list as requested could be made up from our card index system of lumber manufacturers in the territory named, involving several thousand stumpage owners and lumber manufacturers. It would, however, hardly be necessary to attach to this list the kinds of lumber produced by these concerns, as anyone familiar with the territory in question would know very closely the variety of lumber each concern produces.

Timber owners desiring to communicate with this prospective purchaser will be supplied with the address by writing Harnwood Ricogo, Lie etc.

B 696-Seeks Five-Ply Table Tops

toya, W. S. al., I. B. S. Hyanwood, R. S. L. W. S. erd very methapprecent it if you could furnish us with a list of manufactures of five ply vines, tade tops.

This has been done. Producers of five ply stock as noted looking for a market for same will be sent the address of the inquirer upon application.— Editor.

B 697-Has Birch for Spools

Glen Haven, Mich. Mar. 12. Editor Hamwoop Ricome: In your issue Dec. 25, 1945, there was a very interesting and excellent article on the spool industey. I am inter sted in information along this line. My private forest on Glen take has a large amount of white birch timber and I have always contemplated utilizing the same along the manufacture of spools, and I would like any information I could receive as to where they are manufactured in this country, and how much of a proposition it is to start the same, or if it could be done in a small way successfully.

I know that such manufacture is generally done on a large line and by combinations, but before entering into it I would like more information on the subject than I have ever been able to obtain. I thought you might be able to give me some or start me where I could learn it.

It might be that if there is any manufacturing point which I could reach by water, I might dispose of the bolts, but of course I would preter to manufacture, and I believe I have enough of it to organize in a small way along these lines. Any information you could give me that would be a benefit, I would appreciate.

Small spools are made almost wholly of paper birch, which is the same as the white birch of Michigan. The center of the industry in this country is in New England, principally in Maine and New Hampshite. The Forest Service, Washington, D. C., has published a circular which gives much information on the spool industry, particularly in regard to cutting, seasoning and working the wood, and also something about the markets. This is "Circular 163, Paper Birch in the Northeast, by S. T. Dana." You can probably procure it by writing to the Forest Service.

There seems to be no manufacturing of spools in Michigan, but some are made in the state of New York.

No reason is known why the paper birch of Michigan will not work into spools as readily as that of New England. The hardest part of the operation is to prevent the wood from sapstaining after it is cut and before it can be properly seasoned. In New England most of the cutting is done in winter, during freezing weather. There is much waste in large timber, because the heartwood is not used for spools and is usually thrown away.

Our correspondent has been further advised that spool operations need not necessarily be on a large scale. A number of small mills in New England seem to be doing as well proportionately as the large ones. A spool machine turns out about a spool a second, and each machine is a separate unit, and may be added as needed.—Editor.

B 698-Spanish Elm (?)

Philadelphia, Pa., Mar. 13.—Editor Hardwood Record: Will you please give us the names of a few firms that use Spanish elm, wholesale or retail, and oblige.

HARDWOOD RECORD is absolutely unfamiliar with any wood of that name. It may be that the inquirer refers to Santo Domingo rose-wood.—Editor.

B 699-What Is Gray Fir?

Philadelphia, Pa., Mar. 16.—Editor Hardwood Record: In looking over "American Forest Trees," we see no mention made of gray fir. We understand that gray fir and western hemlock are the same wood. We mean such a wood as comes under the name of western hemlock and

Kindly give us any reference to this and oblige.

HARDWOOD RECORD can find no reference to "gray fir" in any authorities on commercial woods of the United States. It may be that this inquirer is correct in his guess that "gray fir" is western

Tembola, as the latter wood has been frequently marketed under other names. Epiron

B 700-Another Specimen of Philippine Wood

To one that Mar B. Editor Hyrowoon Record. We are sending con a trace a word and would like to have you fell us what this is, and writt if a good for . It is from the Philippine Islands, and is shipped a little of the sending of t

Pank to you in advance for your court sy in the matter, we are

The specimen referred to has been received and it is evidently Pagattat Secretation panetrate Blee, family (Sonneratiaceae).

According to the report of the Philippine Bureau of Forestry, this wood is regarded as being available for piling, poles, general heavy construction and ship, wharf and bridge building, interior finish, flooring, furniture, ties, musical instruments.

The report further says that the wood has an excellent reputation for durability and seems to be insect-proof. The sap wood is grayish or pinkish, not sharply marked off from the dark brown heartwood. It is heavy, hard, salty taste, fine, even grain, and easy to work. It is found in all coastal swamps of the Philippines, but relatively large and abundant only in the southern islands. Besides, the growth is small to medium and of fair length. The reported price two years ago was \$57.50 to \$60 f. o. b. Manila.

Of course it goes without saying that this wood is not walnut, and could by no stretch of the imagination, except in the matter of approximate color, be regarded as walnut.—EDITOR.

B 701-Seeks White Hickory and White Ash

New York, N. Y., Mar. 10.-Editor (Hardwood Record: I wish to obtain, white hietery, also white ash, second-growth, rough edge for bending into shafts. Must be straight-grain and best quality for export. Sizes $1^{1}z^{\prime\prime}$ to $2^{1}z^{\prime\prime}$ thick, $4^{\prime\prime}$ and up wide, $10^{\prime\prime}$ and up long. Can any of your readers advise me where I may obtain such material in carload lots?

Sources of supply for this material have been supplied our New York inquirer. Manufacturers of this stock seeking an opportunity to dispose of some of it will be placed in communication with this prospective customer upon request.—Editor.

B 702—Seeks Maple Mangle Rollers

New York, Mar. 12.—Editor Hardwood Record: Will you kindly give me a list of names of manufacturers of maple mangle rollers for export and oblige?

Hardwood Record knows of no one who specializes in the production of maple mangle rollers. Think quite likely they are made on special orders.

Anyone getting out these rollers and desirous of communicating with above will be supplied the address upon request.—Editor.

B 703-Wants to Purchase Flooring Booklet

New York, N. Y., Mar. 16.—Editor Hardwood Record: We would like to know where we can get a few thousand of the small booklets published as "The King of Flooring."

HARDWOOD RECORD is not familiar with the book in question. If any reader in a position to supply the name of the publisher of it will communicate the information to HARDWOOD RECORD it will appreciate same.—EDITOR.

B 704—Veneer Strips for Packing

Henderson, Ky., Mar. 12.—Editor Hardwood Record: We are interested in some veneer strips, 2½" wide, very light that we tie on top of shefts to avoid being marred in shipment. Do you have anything in this line? It so, make us your best price.

HARDWOOD RECORD, of course, does not handle anything of this sort. If any manufacturer who can supply these strips will communicate with this publication, the name of this prospective customer will be supplied him.—EDITOR.

B 706-Wants White Hickory and White Ash Second Growth

Syracuse, N. Y., Mar. 20.—Editor Hardwood Record: We have a request for white hickory and white ash second growth, rough edges for making into shafts, straight grain and best quality for export. It is desired in carload lots, 1% inches thick, 4 inches and up wide and 10 feet and up long. If you know where we can get this material I will be very glad if you will furnish us with the names of a number of such concerns.

B 705-Has Excellent Mahogany to Offer

Liverpeal, England, Mar 20. Editor Harawoon Ricome. We are in a position to supply your markets with richig figured African mahogany logs suitable for high class veneer purposes. We have an especially fine richly figured log that has been cut into two pieces as follows: 10½ feet long by 48 feet deep. We are forwarding under separate cover sample taken from this log, and if any of your readers are interested, perhaps you will be kind enough to show them the sample. Upon inquiry will be pleased to submit lowest poinces.

Clubs and Associations

The Maple Dish Association Organized

The Maple Dish Association, an organization of manufacturers of maple dishes, formerly known as wire-end butter dishes, has just been formed. The sole and only object of the association is to exploit in all legitimate ways the sanitary and other advantages of the maple dish as a container for foods dispensed in retail stores. An extensive advertising empaign was outlined, and the jobber, retailer and consumer of foods will be informed through direct circularization and appropriate publications of the convenience and safety of maple dishes as desirable over other food containers, in the manufacture of which chemicals are used, and in the handling of which germ contamination is probable.

At a meeting in Chicago, at which the association was formed, were present M. B. Wallace of the Escanaba Manufacturing Company, Escanaba, Mich.; F. M. Longnecker of the Oval Wood Dish Company, Delto, O.; Howard Smith of the Ludington Woodenware Company, Ludington, Mich.; W. C. Hull of the Oval Wood Dish Company, Traverse City, Mich.; Mr. Parish of the Rielmond Cedar Works, Richmond, Va., and Riley Sweers of the Oval Wood Dish Company, Delta, O. An organization was perfected, of which Riley Sweers is president, F. M. Longnecker, treasurer, and Sterling Besson, secretary, Offices have been established in Suite 44-55 Produce Exchange, Toledo, O.

Manufacturers of maple dishes believe that their product has much to recommend it to both retailer and consumer, and it was decided to tell the world something about it. Points which will be emphasized in the publicity campaign will be lightness, durability and sanitary features of the maple dish. The old name of wire-end, or butter dish, will be abandoned, and that of maple dish henceforth used. All these dishes are cut from sugar maple timber.

Commissary Managers Will Meet

The fifth annual convention of the National Commissary Managers' Association will be held at Hotel Seelbach, Louisville, Ky., Aug. 18-19, 1914. The president of the association is C. C. Jackson of Graysonia, Ark., the secretary Tracy D. Luccock, Chicago, Ill.

Defines Income Tax on Logs

Secretary J. E. Rhodes of the National Lumber Manufacturers' Association gives in a recent bulletin an explanation of the application of the income tax to saw logs. The following statement was made to the association by the Commissioner of Internal Revenue in response to questions as to the tax on timber which should be placed on logging operations: "Cost of logging is the money originally paid therefor plus the additional actual expenditure, if any, from the time of purchase to the time of producing logs, not including interest—estimated, simple or compound. The difference between the cost and what the logs sell for is profit or loss. Determination of profit or loss and accounting, therefore, for income purposes, must be ascertained by consideration of facts relevant to tax purposes."

Monthly Meeting Philadelphia Exchange

The Lumbermen's Exchange held its monthly meeting, which had been postponed on March 12 President Benjamin Stoker in the chair. President Stoker, who represented the exchange at the convention of Chamber of Commerce of the United States, held in Washington, D. C., February 10, 11, 12 and 13, read a report of the work done there. He was most enthusiastic over the class of men assembled and the great work which was being handled by the organization. Charles P. Maule, treasurer of the exchange, who was a delegate for this body at the National Wholesale Lumber Dealers' convention at Buffalo, gave an interesting report of his trip and experiences there. The Long Bell Lumber Company, which has opened a Philadelphia office, and F. W. Aszmann of this city were elected members of the exchange.

The special feature of this meeting was the discussion of the question, "How Can the Lumbermen's Exchange of the City of Philadelphia Best Serve the Lumber Interests of Philadelphia and Vicinity." The subject was ably handled by Thomas B. Hammer on the wholesalers' side and Charles M. Chesnut on that of the retailers. The discussion was a lively and interesting one, and it is believed that the opportunity afforded the members of the exchange to express their views on vital maters of this kind, will surely result in a better understanding among the various lumber handlers as to the advantages of association work and the get-together

spirit for consultation on a little is a light full interest. The rest of the

meeting was devoted to routine objects.

On March 10 all of the map easily to excharge who have railroad sidings in their yards assembled in the exchange tools to express their opinion regarding the intention of the railroads to place a tax of \$2 on every car that runs in on the sidings. Horace A. Reeves, Jr., chairman of the railroad and transportation committee of the exchange, presided, Those present strongly protested against this action of the railroads and a committee of eight was appointed to go to Washington on the following day to urge before the Interstate Commerce Commission their protest against this unjust tax. Edward F. Henson of E. F. Henson & Co. was selected to act as speaker for the committee.

With the Nashville Lumbermen's Club

On Tuesday, March 10, the following new officers were elected to the Nashville Lumio rachi. Club wit-

Nasayan Lumedalen (19.6 a) it operation.
Presureal Henderson Baka B. P. J. dols & co.
Vio. Fires to C. C. Harr, Bare, Was major, & Smith.
The stage Harr defended brook belowds in Hole & Steen Company.
Stein day Con. Ewing, Servent Lindschaft deem Company.
M.A. Diraccoust & T. Raison, Harmon Leve, Percy Locvenhart,
Willis Farris and Morford Whitson.

Paramount above the annual election of officers at the meeting was the information filed by Secretary Ewing to the effect that the Louisville & Nashville Railroad would in all probability at an early date permit the substitution of "hardwoods in" for "hardwoods out" in the milling-intransit arrangement. Since the date of the meeting that provision has gone through

The Nashville club has contended for this relief for more than six months, and the accouncement of the intention of the Louisville & Nashville Railread to supply new tariff on lumber offering the desired relief was received with much gratification.

In the milling in-transit decision affecting shipments of grain, shippers have not been required to preserve its identity on outbound shipments Lumbermen have contended for this same privilege. Under the old arrangement it is necessary to ship oak outbound for oak inbound, and ash outbound for ash inbound, it being impossible to substitute one for another.

Memphis Club Holds Semi-Monthly Meeting

The Lumbermen's Club of Memphis held its regular semi-monthly meeting on March 21 at the Hotel Gayoso, with fifty-nine members and guests present. J. D. Allen, Jr., was in the chair and the usual luncheon was served.

Although the club did not take definite action regarding the ordinance which has been introduced here providing for the elimination of wooden shingles as a house covering in the residence districts, there will be positive action at the meeting two weeks hence. The club is distinctly opposed to the general principles of substitution which is involved in this ordinance and, as one member declared, if this were allowed to pass by default there is no telling where the next move will be made by those who are responsible for the substitution propaganda. It is true that there are few members of the club who would be directly affected by the substitution provided for in this instance, but there were a number of talks made, the burden of which was that a distinctly lumberman's organization should speak in no uncertain tone regarding this principle. The information and statistics committees have been asked to gather all the data obtainable and when they make their reports the club will make its position known in no uncertain way.

Technicalities in present fire insurance policies also came in for much discussion in connection with the request of R. J. Lockwood, general manager of the Memphis Hardwood Flooring Company, that he be allowed to write a letter to lumbermen throughout the United States, on the stationery of the club, calling attention to the failure of the New York Lumber Underwriters to pay the Rife & Stutzman claim which originated several years ago on an alleged violation of the clear space clause. He said that Judge John E. McCall, of the federal court for the western district of Tennessee, had excluded certain very important testimony and that the case was to come up for trial in the United States Supreme Court. The club took the position that Mr. Lockwood would have to draw up this letter and submit it to the law and insurance committee of the club in order that there might be nothing said therein that would in any way lay the organization liable for damages. S. M. Nickey, chairman of this committee, pointed out that there were so many technicalities in fire insurance policies written nowadays that the club ought to take some action that would influence the fire insurance companies to write such policies that the average business man could understand the provisions thereof without the aid of a lawyer. He further said that there were so many technicalities now that some insurance companies could, by hiding behind certain clauses and provisions, vitiate the fundamental purpose for which these policies were issued, namely, protection. There will be something done in connection with this subject within the next two or four weeks, following the submission of a draft of his letter to be furnished by Mr. Lockwood.

F. E. Stonebraker, chairman of the special committee having in charge the finishing and furnishing of the rooms in the Business Men's Club to be occupied by the Lumbermen's Club, thanked the members of the latter for furnishing the necessary material to enable the committee to finish the rooms in panels made of practically all the hardwoods produced in this territory.

C. D. Hendrickson, charman of the river and rail committee, read a letter from Joe Hattendorf, general freight agent of the southern lines of the Illinois C ntral system, stating that facilities had been completed at Memphis for the payment here of all refunds on log shipments and also the payment of all over rate claims. The letter further stated that tation of the proper docum many evidence to establish the justice of the made part of the records of the club. This letter was the direct out growth of conferences held between the river and rail committee and officials of the Illinois Central some time ago,

A letter was read from the National Rivers and Harbors Congress ask ing the club to state its position regarding the proposed repeal of the exemption from Panama Canal tolls in case of vessels engaged in coastwise trade. The subject was referred to the information committee,

George T. Kendal of Hugbart & Kendal, Grand Rapids, Mich., was *elected an associate member of the club. There was one other application which will be voted on at the next regular meeting.

Following the regular meeting two weeks ago, the directors convened and passed on a number of matters of a routine nature, including the disposition of the expenses incident to complimentary tickets at the recent tango party given by the club at the Hotel Chisca.

North Carolina Forestry Meeting

The fourth annual convention of the North Carolina Forestry Association will be held at Asheville on Wednesday and Thursday, April 8 and 9, 1914.

The Appalachian Park Association will meet with the forestry association, thereby greatly increasing the interest of the gathering. sides the morning and evening sessions of the convention, a trip will be made to the forest plantations of the Biltmore estate on Wednesday afternoon, and the next day the delegates are invited to visit the spruce forests on Mt. Mitchell over the logging railroad of Messrs, Perley and Crockett

Governor Craig will be present and address the convention. the other smakers who are expected are H. S. Graves, United States Forester, H. S. Ridsdale, secretary of the American Forestry Association; Mrs. T. W. Lingle, chairman department of civies, North Carolina Federation of Women's Clubs, and W. B. Townsend, the well-known lumberman and conservationist of east Tennossee.

Special rates on all railroads are being arranged for, and the local hotels are offering favorable terms.

Chicago Association Will Hold Regular Meeting

A meeting of the Lumbermen's Association of Chicago is called to convene in the Red Room of the Hotel La Salle, March 27, at 12:30 p. m. sharp. Luncheon will be served.

Subjects which will come up before the meeting are: Report of traffic committee; report of committee on fire limit extension, report of entertainment committee and other matters for the good of the members. The meeting will be strictly a business gathering, and it is hoped by the officers that there will be a good attendance.

Annual Election Chicago Club

On Monday evening, March 16, the Lumbermen's Club of Chicago held its annual meeting at its club-rooms in the Great Northern Hotel building, for the purpose of electing officers for the ensuing year, and for a discussion of the various questions that directly affect the local club and association work. As a result of the election, the following officers were chosen for the coming year:

PRESIDENT—A. C. Quixley, Quixley & Bulgrin Lumber Company. Vice-President—Charles Westcott, Hayden & Westcott Lumber Com-

uny. Trrasurrer—H. D. Welsh, E. A. Thornton Lumber Company. Secretary - George C. King. Trustres for There, Years—John Claney, H. B. Darlington and F. R.

TRUSTEES FOR ONE YEAR S. C. Bennett and A. H. Ruth,

The meeting and elaborate dinner which was served were attended by more than 200 lumbermen and guests.

Among the questions which came up for discussion at the business session following the dinner, was the suggestion propounded by Retiring-President F. R. Gadd, to the effect that the Lumbermen's Club be amaigamated with the Lumbermen's Association of Chicago, when the two organizations are housed in the new Lumbermen's building that will be opened up within a year.

Mr. Gadd's suggestion proposed the formation of an organization of vast power that would have both social and business features. It was well received by the members, and President Quixley on taking the chair expressed himself as being favorable to the project.

The question of substitutes of wood also came into discussion and a sentiment seemed to be prevalent that the uses of substitutes did not augur III for the lumber trade but rather tended to increase the demand for the products of the forest. The truth of this contention however, is open to argument.

At the conclusion of the banquet, E. A. Thornton, in behalf of the Lumbermen's Club, presented Retiring President Gadd with a handsome gold watch as a token of esteem of the members and their appreciation of his excellent handling of the affairs of the club. Mr. Gadd thanked the members through Mr. Thornton, suitably.

Our to the old the usings session were repetite of Treasurer S. C. Bernett, which showed the chartes of the clum in excellent condition to the cluster C. Burn, seeing ty.

The control of the control of the cut-transient committee was tendered by the members for the cut-transient distribution of the cut-transient of the control of the control of the control of the committee.

Teleowin, its election to the office of president, A. C. Quixiev was econord to the chain to the committee appointed by Mr. Gadd. He expressed himself as duly appreciative of the honor bestowed upon him, and migod these present to assist in the work of obtaining new memori-

With the Trade

A Correction

. Just previous to the last issue of (Lamwood Raconn the), was received in this office notice from the Arlantic Lumber Company, Boston, the working of which give the distinct impression that that company had moved its headquarters to Toronto, Out.

Word has been reserved from the company that the notice run to that clear was incorrect and simply head to do with the removal of the Toronto often from one building to another.

New Manistique Plant Ready for Operation

As announced previously in Hambwoon Riccom a sile to: the new Manistique Hardle Manufacturing Company plant has been purchased by the Manistique Commercial Club, and operations will begin as soon as machinery can be pleced.

The company will start operations in the building formerly owned by the Consolidated Furniture Company. The Commercial club put up \$1,000 for its use, this being the second appropriation since the first of the year.

The new Williams Flooring Company will start breaking ground for its new plant at Manistique about April 1.

I. F. Balsley Moves to Philadelphia

I. F. Balsley, a veteran hardwood man of Pittsburgh, Pa., has gone to Philadelphia, Pa., where he will handle the stocks of the Craig County Lumber Corporation, whose mills are at Walteville, W. Va., and shipping point at Ray, W. Va. Mr. Balsley is perhaps as well known as any wholesale hardwood man in the state. He was for many years with the oid Mead & Speer Lumber Company, later for five years with the Willson Brothers Lumber Company, then manager of the Palmer & Semans Lumber Company and for the past two years an independent hardwood weblesaler.

Indianapolis Concern Expands

The American Timber Products Company of Indianapolis was recently incorporated with a capital stock of \$50,000. This concern has been operating as an unincorporated company for some little time, O. M. Pruitt being president. The concern started out to handle veneer logs and flitches for veneer companies, but gradually enlarged its business so that it eventually was handling an extensive line of high-grade veneers to consuming trade. The incorporation was for the purpose of giving it an operation of its own and further enlarging its scope.

Shortly after the incorporation the company purchased the Murdock mill at Indianapolis, which is a veneer mill that was constructed a short time ago but never run on account of the death of its owner. The mill is well arranged and is equipped at present with two saws. The American Timber Products Company is planning to add another saw and probably a slicer and band saw within the year. As it is now operating it has a first-class contract for flitches and for slicing. This company is catering only to high-class trade and hence its stock is in every particular all that could be expected or desired. Mr. Pruitt states that the company will continue to handle veneer flitches and veneer logs.

Provision has been made in the incorporation whereby the capital stock can be increased as the extent of the company's operations are increased.

Baldwin Locomotive Works Active

The Baldwin Locomotive Works closed a contract with the Illinois Central railroad recently for the construction of fifty locomotives of the heavy Mikado type. They also received orders for one ten-wheel locomotive from the Arkansas Lumber Company; one "2-6-2" type for the J. R. Buckwalter Lumber Company, Union, Mass.; six ten-wheelers for the Georgia Southern and Florida railway; one Mikado type for the Mason County Logging Company of Bordeaux, Wash.; one four-coupled engine for the city of Newark, N. J., and one "2-6-2" type for the John L. Roper Lumber Company, Norfolk, Va.

Fire Destroys Plant of Jerome H. Sheip

A disastrous fire visited the cigar box lumber plant of Jerone II. Sheip, Incorporated, at Choetah Point, Mobile, Ala., on March 5, at 2 o'clock in the morning, creating a loss of from \$100,000 to \$110,000. The fire started in the dryer, where men are employed all night, but nothing definite can be learned as to the origin. The destruction of the entire plant was rapid, but the Mobile fire department fortunately succeeded in confining the fire to the manufacturing section, thereby saving some 480 stacks of dried lumber cut to the thickness of a cigar box top, and which in its dry state would have been an easy prey to the flames and a heavy addition to the loss. In addition to the destruction of the mill proper, the veneer cutting mill was burned to the ground, including the ruination of one of the only two cedar veneer cutting machines in that section of the country. The cutting machine, which is an entire loss, had an eighteenfoot, razor blade knife, and cost \$18,000. Other special heavy losses include a new additional engine put in a year ago at a cost of about \$25,000, and a new dryer, put in a little later. Jerome H. Sheip, president of the concern, who had spent a week at the plant, left for Philadelphia the night before the fire. He did not hear of the accident and its ravages until he reached this city. Mr. Sheip deplores the disastrous interruption of the business at this time, as they have been fairly busy right along, The loss has been fairly covered by insurance, and the rebuilding of the plant will begin as early as possible.

Colorado Firms Buys New Mexico Timber

The Hallack and Howard Lumber Company of Denver, Col., has just bought 117,000,000 board feet of timber on the Carson national forest, New Mexico. The timber is purchased under competitive bids at a stumpage rate of two dollars a thousand and the species to be cut include yellow pine and Douglas fir.

The timber is located at the headwaters of Vallecitos creek and in order to successfully log the area the company is planning to establish a large mill near the Schomburg holdings and has already started the survey for a railroad from Caliente Siding on the Denver & Rio Grande Railway. The contract provides for a cutting period extending over ten years. Actual lumbering will commence July 1, 1915.

In addition to the 117,000,000 feet purchased from the government, the company has also secured 30,000,000 feet of privately owned timber in the same neighborhood and will cut this in connection with that from the government holdings.

Forest officers say that the Carson forest will be greatly benefited by this sale. It will take the large mature timber which will be cut into lumber and railway ties. Furthermore, they think that it will mean a great deal for that part of northern New Mexico, which is susceptible of considerable development, this new timber activity being one of the largest industrial undertakings in that locality within the past decade.

Changes to Cincinnati Concern

Clyde E. Jones, formerly with the Lamb-Fish Lumber Company, Charleston, Miss., announces that he recently took a position with the Korn-Conkling Company, Cincinnati, O., and will travel in Illinois, Iowa, Michigan, Minnesota, Wisconsin and Indiana. Mr. Jones has called on the trade from the Missouri river east to New York City, and is thoroughly acquainted with the majority of consumers.

He will make his headquarters in Chicago at his residence, 4351 Kenmore avenue.

Chair Company to Enlarge

In the fall of 1912 the Charlotte Chair Company, Charlotte, N. C., was organized for the manufacture of dining chairs. The company took over the Potter factory and after instailing modern machinery has been operating there ever since, starting with a force of about twenty-five men, and ultimately employing over fifty.

The plant has a capacity of 150 chairs a day and inasmuch as it has been running behind in orders for some little time, the officers recently decided to effect a reorganization which was done about the middle of February. New capital was taken in and it is now the intention of the company to enlarge the plant permitting of an output of 250 chairs daily.

Chair Company Will Erect New Factory

Following the increase in capital from \$25,000 to \$100,000, which was effected for the purpose of supplying funds, the John D. Raab Chair Company of Grand Rapids, Mich.. is to crect a new factory building at Monroe avenue and Mason street, that city. The structure is to be 200x220, four stories high.

With the completion of the new home, the company will no longer be forced to seek exposition quarters outside the plant. Work will be commenced in the near future.

Michigan Furniture Company to Erect Building

The Michigan Furniture Company, one of the largest concerns of its kind in Michigan, is arranging to erect a seven-story building in Springfield, O. Arrangements have been made by E. D. Kahn and the structure will be erected at the corner of Main and Limestone streets. The building will be used for business purposes.

Knoxville Veneer Company Expands

The first of the year the Knoxville Veneer Company of Knoxville, Tenn., increased its capital stock to \$100,000. This increase was necessitated by the company's rapidly expanding business and several innovations in the way of utilizing waste, also the necessity for the improvement and enlargement of its plant. P. B. Raymond, president of the company, states that on Saturday, March 14, ground was broken for a new warehouse which will be erected in connection with the plant's factory and which will be of two-story brick construction 24 feet high and 80x140 feet on the ground.

The Knoxylle Vener Company researcy installed a circular sawmill in connection with its plant for sawdig flathes. Dust and can turn out flitche up to rorty eight index A be company has a very extensive lot of luggery of coal and without ϕ and ϕ roty is varied. It is ranging time and, in tact as having difficulty ϕ , aparg ap with its orders

Robert Stimson Locates at Memphis

Robert Strison on of J. V. Strison of Hunting errg, Ind., ast week located at Monajdas where he will the charge of the new corporation formed to operate the C. L. Willey vener and lumber plant. Mr. Stimson expects to just the veneer mill in shape to run immediately and will begin to produce rotary veneers for the market. Mr. Stimson will have full charge of the new Stimson operations at Memphis. The plant is to be one of the best sawmill plants located in the South.

Death of L. T. Spragins

L. T. Spragms of the firm of T J Spragms & Son Bed Miss, was killed about a week aga at the company's operations, death being caused by a log redding on bin from a orr.

Mr. Spragins was born in 1876 and had been connected actively with lumber operations with his father for a number of years. From 1899 to 1902 Mr. Spragins and his father were located at Demejolis, Ala. In 1903 they removed to Carrollton, Ala., remaining there for two years, He later was connected with his father in operating mills in Wilkinson county, Mississippi, and later in Adams county, Mississippi, the last mill being at Bude, the operations now being maintained by T. J. Spragins & Son.

The accident occurred on Friday morning, March 13, and the funeral was held at Port Gibson, Miss., on Sunday, March 15.

John H. Murray Dies at Eureka Springs, Ark.

John H. Murray, one of the best sawmill men in the country, died at Eureka Springs, March 6, of kidney trouble. Mr. Murray had been in poor health for over a year and lead gone to Eureka Springs in the hope that his health might be improved.

Mr. Murray was born at McConnellsville, O., on August 3, 1841. He was engaged in the sawmill business in Indiana for over forty five years cutting walunt, and it is stated that during that time he cut the first carload of quartered eak ever produced. He moved from Indiana to Obion, Tenn., and from Obion went to Murray, Ark., where he was engaged extensively in the manufacture of walunt and cherry, his mill being located fifty miles from the railroad. He removed to Galard City, Ark., where he had been located for over ten years up to the time of his death. Uncle Joe, as he was familiarly known to his friends, spent much of his leisure time in hunting, being an excellent shot in spite of his having only one arm.

Mr. Murray is survived by one son, a daughter and a brother. The remains will be taken to Indiana for burial. The funeral took place on March 10.

Will Operate Mill in Wisconsin

The Vetter Manufacturing Company of Wausau, Wis., has purchased upwards of 1,600 acres of timberland, a forty-acre mill site and sawmill, all located in Marathon county, Wis. These deals have been pending for about three months.

The timberland is located near the town of Knowlton and contains approximately 10,000,000 feet of hardwood and hemlock timber. It is compact and readily accessible for logging operations. The sawmill is on the banks of the Eau Claire river, about nine miles cast of Knowlton station.

The sawmill of the Johnson Creek Lumber Company near Knowlton has been purchased and is being moved into this site. The nill has a daily capacity of 40,000 to 50,000 feet.

Canadian Linderman Company in Progressive Enterprise

Hardwood Riccord was recently in receipt of a communication from F. C. Cheston, general manager of the Canadian Linderman Company, Ltd., Woodstock, Ontario. Mr. Cheston's letter was inspired by a short Item appearing in a recent issue of Hardwood Record, in which an endeavor was made to treat humorously a suggestion appearing in a country daily to the effect that a wonderful edger which had come under the observation of one of the reporters of that paper turned out 24-inch lumber from any old kind of stock that went in. Of course this edger was simply an ordinary edger and the construction of the sentence left grave room for doubt as to the ability of the machine to perform the work referred to.

Mr. Cheston, however, raises the question that this work is actually being done, although the total width is gotten by adding on other pieces. Mr. Cheston says that he has had the proposition up with Canadian manufacturers for several years, and has finally convinced the large, progressive companies of the Dominion that there is a large saving in the process.

In the Canadian northwest, east of the Rocky mountains, according to Mr. Cheston, there are vast quantities of spruce, most of it being small timber which yields from twenty-five to forty per cent of 3-inch or 4-inch narrow widths. The best of this is used for flooring and other similar purposes, but the common grades sell for what can be realized for them, prices ranging usually from \$7.50 to \$0 a thousand. Mr. Cheston says that his suggestion was that these companies leave the narrow widths to air dry for ninety days, after which they can be run through a

Linderman machine and two 4 inch strips run together, making a board of any length up to 16 feet mat will be 7% inches wide. This board can be put through a matcher and converted into shiplap, which brings from 844 to 846 per thousand at the mill.

Mr. Cheston, the suggests that No. 3 grades of lumber on the prairie increase rapidly in price, according to width, there being a variation of 85 between 4 inch and 6 inch No. 3 grades, and 10 inch and 12 inch No. 3 grades.

The plun also includes the making of all lamber of equal lengths, which is proving to be practical and economical. For instance, 31nth strips 16 foot long are infined to one or more pleces on any length whose combined length equals 16 feet. There is then joined to this piece two or more lengths whose combined length makes 16 feet. On the outside of this composite bound a binding strip 2, 3 or more inches wide is joined through the Linderman machine. Such a composite bound as this can be used for suf-flooring, partition work, sheathing and similar work being very well adapted for these uses. This operation can be performed at a cest of not exceeding one dodar per thousand feet.

As proof of its taith in the proposition, the Linderman company recently ran several thousand feel of 4 foot sprine through a matcher, and then used it to cover the outside of a number of its buildings. When painted, it was impossible to discover any openings between the floards at the joints.

Ohio Furniture Company Purchases New Machinery

The officers of the Anglaize Furniture Company of New Bremen, O., last week completed the purchase of new machinery for the factory which that company is erecting. The question of individual motor drives is also being considered and it is anticipated that these purchases will also be consummated in the near future.

The work of erecting the plant is about completed, the carpenters now being busy with the interior finishing. It is expected that by the time the machinery arrives, concrete floors will be ready for installation and that the operation of the shops will be started in the early spring.

Prominent Boston Lumberman Dies

Willis C. Bates, pretainent figure in New England lumber circles, died suddenb on Meadyy, March 2. His death come as a great shock to a large number of those in the trade as he was in his usual good health up to an hour or two of his deeth.

Mr. Bates was born in Coventry, R. I., in 1858. He was engaged in the lumber business in Coventry for some time, but came to Boston a quarter of a century ago, and was associated with J. & A. Hurd & Co. Later he became minager of a branch of Shepard, Farmer & Co., until he organized Willis C. Bates & Co. about ten years ago. He has been treasurer and manager of that concern since commencing the business.

Mr. Betes was a thirty-second degree Mason, an Old Fellow, a member of the Ancient and Homorable Artillery Company of Boston, and a member of several clubs. H+ was widely known in a business way and had a host of friends.

The funeral was held Thursday afternoon at his late residence, 35 High street, Canton, Mass.

Pertinent Information

Eight Large Redwood Logs

Eight logs were recently cut from a redwood tree in Humboldt county, California, the largest measuring twelve feet and the smallest nine inside the bark. Their aggregate length was 174 feet. The smallest scaled 12,042 feet, the largest 17,778. The total measurement of the tree was 126,976 board feet. This may not be the largest output for a single tree, but no record exceeding it seems to be at hand.

A Mammoth Michigan Elm

What was probably the largest tree in southern Michigan was cut recently on the Daniel Cullinane farm in Silver Creek township, near the Cullinane schoolhouse. This monster was an elm and furnished seven logs, the butt log being the shortest and scaling 1,400 feet. The rest of the tree was large enough to bring the total measurement up to nearly 7,000 feet, a record which has not been made during the past fifty years in Cass county. But one log at a time could be hauled, owing to its size, and one team could not handle the first one. It is not known how old the tree was, but it is estimated to have been at least 200 years old, if not older.

Hearing on Rates from Batesville to Points North and East

There was a hearing at Memphis Saturday, March 14, in the case of the Southern Hardwood Traffic Bureau, on behalf of R. J. Darnell, Inc., against the Illinois Central Railroad and forty-two other carriers, involving rates on hardwood lumber from Batesville, Miss., the location of the big double band mill of R. J. Darnell, Inc., to points in the North and East. The plaintiff was represented by J. R. Walker, attorney of the Southern Hardwood Traffic Bureau, with headquarters at Washington; J. H. Townshend, general manager of the bureau, with headquarters at Memphis, and Elliott Lang, traffic manager for the firm in whose behalf the suit was brought. E. K. Bryan, assistant general freight agent of

the Larois Central, Joseph Hattendorf, general freight agent of the southern lines of the Illinois Central System, and C. B. Drayton of Washmaton appear d for the defendant roads. The hearing was before J. T. Hines, special examiner for the Interstate Commerce Commission.

The principal contention of the plaintiff was that the rates from Batesville are materially higher than those from Sardis, nine miles further north. The present rates from the latter point to northern and eastern destinations are three cents over the Memphis rate on all hardwoods, while the rates from Batesville are three cents higher on cottonwood and gum and six cents higher than the Memphis rate on all other hardwoods, It was pointed out that, while a manufacturer at Sardis and Batesville are on the same basis with respect to cottonwood and gum, there is a differential of three cents per hundred pounds on all other hardwoods in favor of the former as against the latter. This means a difference of \$1.50 per thousand on oak, ash, hickory and other hardwoods, excepting cottonwood and gum, while the difference in point of distance is only nine miles. This is alleged to be undue discrimination.

The principal argument advanced by the representatives of the defendant roads was that Sardis, which is fifty-two miles south of Memphis, lies within one of the so-called 50 mile zones, and that the commission has itself gone on record against disturbing these zones unless there is extreme reason therefor. The railroads also pointed out, through their counsel and witnesses, the fact that a rate of three cents had been made on gum and cottonwood from Batesville because the market for these items was slow and needed a stimulus, while the other hardwoods did not need such treatment.

The bureau is seeking a rate of three cents over the Memphis rates on all hardwoods, the same as now enjoyed by Sardis, nine miles further north. No decision will be made until the testimony adduced at this hearing has been laid before the entire commission. The defendant roads offered a compromise of four cents above the Memphis rate before the hearing was held but this was refused.

J. H. Townshend, general manager for the bureau, is in receipt of information to the effect that within the next two or three weeks the carriers will issue new tariffs providing for an over-lumber rate on spokes, flooring, handles, tight cooperage material and other products made from hardwood lumber. This is to be done in accordance with a suggestion from the Interstate Commerce Commission, which was made in connection with the case of the Eastern Wheel Manufacturers' Associations vs. the Alabama & Vicksburg and other carriers. These products have heretofore taken the same rates as lumber, but the new tariffs will, according to information received here, establish an arbitrary rate somewhat above current rates on hardwood lumber for everything manufactured therefrom. Memphis is a large manufacturer of hardwood products and the bureau will take this matter up as soon as further definite information has been received as to the rates to be promulgated by the roads in question.

George D. Burgess, president of the Southern Hardwood Traffic Bureau, left Memphis Tuesday evening for Chicago. He will go thence to Washington, where he will confer with J. R. Walker, attorney for the bureau, in connection with the efforts being made by the latter to secure a rate of eleven cents from Memphis to New Orleans on all hardwood lumber. This matter is to be fought out before the commission by means of an intervening petition when the case of the Bellgrade Lumber Company et al. vs. the Illinois Central and Yazoo & Mississippi Valley roads, involving rates of eleven and ten cents, respectively, on hardwood lumber shipments from points in Mississippi above and below the main line of the Southern Railway to New Orlenas.

Important Arkansas Rate Questions

On March 12 a hearing was held in the United States district court before Special Master Judge J. G. Wallace on the exceptions filed by the railroads to claims for overcharges filed by lumber and stave mills on shipments made under the rough material rates during the pendency of the Arkansas rate case. According to the custom, the stave mills entered into a contract with the railroads whereby, in consideration of the reduced rates, the mills agreed to reship a certain percentage of the manufactured products over the road which brought in the rough material. The rough material for the most part was hauled from Arkansas points to the mills, which are also located in Arkansas, and, generally speaking, the finished products were shipped to foreign states. roads contended in the hearing that, inasmuch as the finished products were shipped to foreign states, the whole shipment, from the point of origin in the forest to the mill and from the mill to the foreign state were interstate shipments, and therefore not subject to claims for refund by reason of the freight charges made in excess of the rates provided by Standard Freight Distance Tariff No. 3, promulgated by the Arkansas Railroad Commission in 1908. The manufacturers, on the other hand, contended that they bought the rough material outright and shipped it into their mills, where it stayed on the average of from three to nine months; that during that time it was their property absolutely, on which they paid state taxes; that at the time the rough material came in they did not know where the finished products therefrom would be sold; that the fact that they did sell the majority of it in foreign markets did not make the entire transaction a matter of interstate commerce.

The principal manufacturing concerns affected by the hearing were the Hub Manufacturing Company of Jonesboro, the National Cooperage & Woodenware Company of Clarendon, J. F. Hastey & Son, Paragould; W.

W. Wilson Stare Company of Little Rock: Henry Wrane & Co. Paragould; Arkadelphia Milling Company, Arkadelphia & Pritchard Lumber Company, Little Rock,

At the conclusion of the hearing Special Master Wallace took the case under advisement and no decision has yet been announced,

The St. Louis, Iron Mountain & Southern Railway Company has filed suit in the Pulski Chancery Court against the W. W. Wilson Stave Company and its successor, the W. W. Wilson & Wrape Stave Company, asking an accounting and a judgment for the recovery of a balance said to be due as freight charges on shipments of rough material to the company's plant in Argenta during the past three years.

The plaintiff alleges that the stave company, in consideration of reduced freight rates on inbound shipments of rough material, agreed to ship out each year over the plaintiff's road manufactured products in an amount not less than thirty per cent in weight of the total tonnage of inbound rough material during that year. It alleges that there was a written contract to that effect and that a regularly established freight rate was made. It further alleges that the stave company failed to ship out over the plaintiff's road the required thirty per cent on about 18,000,000 pounds of rough material shipped in during the past three years. The plaintiff company alleges that it is therefore entitled to make a full charge, based on the local freight rate, on all the foregoing tonnage in lieu of the rate which was charged. The difference between the reduced rate and the legal local rate is alleged to be \$6,368.93, which amount is asked in judgment by the railroad company.

The Chicago, Rock Island & Pacific Railway Company has recently made a proposition to compromise the claims for refund on overcharges against that road arising out of the excess freight and passenger rates charged during the past five years over those as fixed by the railroad commission in 1908. Under the terms offered by the railroad said company is to pay into the court the sum of \$30,000, which is to be used in paying a pro-rated amount of all claims filed for refund of overcharges made in rassenger fares during the above mentioned period. It also offers to pay into the court the sum of \$100,000, to be used in the same manner for liquidating the claims filed against said company for the refund of excess freight charges made during the above named period.

This proposition has been endorsed by the three members of the Arkansas Railroad Commission, by Attorney General W. L. Moose, by Special Counsel Judge Jos. M. Hill and by Governor George W. Hays, This proposition of compromise will be submitted to Judge Jacob Trieber of the United States District Court at this place, and all claimants will be given an opportunity to be heard as to whether or not they desire to accept the proposition as made or continue the litigation. Judge Hill. who has conducted these cases for the state since 1908, is of the opinion that this is a fair settlement in that it insures the continuation of the two-cent passenger fare rate and the rate as fixed by the Arkansas Bailroad Commission in what is known as Standard Freight Distance Tariff No. 3. He thinks that the shippers and consignees will realize from thirty to fifty per cent of their claims for freight overcharges, and that the passenger refund will be paid practically in full, as the amounts which will be proved will be less than the actual amounts of overcharges made by the railroads.

A Forestry Law for Virginia

A forestry law, the first that Virginia has ever had, was passed by the Virginia Assembly on Friday, March 13, after a campaign waged for several weeks by the American Forestry Association, it being an important part of the association's work to secure the passage of forestry laws in the various states. The association sent its representatives into the state several weeks ago and in talks with prominent residents and by articles in the newspapers presented to the citizens the needs of the state for proper forestry management of its timberlands and its waste lands unsuited for agricultural purposes. The state's forest products are estimated as being worth \$30,000,000 annually, and its forested area is 15,000,000 acres. Forest fires have caused a loss of about \$350,000 annually for several years. The state ranks sixth in lumber production, but despite this previous efforts to secure the passage of a forestry bill were failures, owing to the general apathy of the citizens and the members of the legislature.

The sentiment aroused by the American Forestry Association, however, was so strong that citizens from every part of the state urged considera-tion of a forestry bill introduced in the Senate by Senator R. S. Blackburn Smith, and following addresses before committees of the Senate and House by S. B. Detwiler, an expert forester representing the American Forestry Association, J. Girvin Peters of the Forest Service and others, the bill passed the Senate unanimously and the House by a vote of 86 to 3. Governor Stuart heartily commended the bill and signed it.

The bill places the forestry work under the direction of the State Geological Commission (composed of the governor, the president of the University of Virginia, the president of the Virginia Polytechnic Institute, the president of the Virginia Military Institute and one citizen from the state at large). Until 1916 the bill provides that the expenses incurred in the organization and operation of the forestry department are to be paid out of the budget of the University of Virginia,

The other provisions of the bill are very similar to those in the law now in successful operation in Kentucky. The principal powers conferred on the forestry commission by the bill are as follows:

The appointment of a technically trained man as state forester. The commission has the power to purchase lands suitable for forest

Peserves at a price not exceeding \$10 per acc. It may establish a forest nursery and distribute seeds and scedlings to efficient under project regulations. If also has the power test of the dead mature or large growth of two so the forest exervations and reso the universal relative mature of the project regulations. New Indiana Housing Law

The Indiana legislature recently passed a new law, known as the "housing law" because it prescribed certain rules which builders must observe in order to lessen fire risks. Among its provisions are the following :

All tenement houses more than three stories high must be of fireproof construction.

The law defines a fireproof tenement house as "one the walls of which are constructed of brick, stone, cement, iron or other hard, incombustible material, and in which there are no wood beams or lintels; and in which the floors, roofs, stair halls and public halls are built entirely of brick, stone, cement, iron or other hard incombustible material; in which no woodwork or other inflammable material is used in any of the partitions, furrings or ceilings.

"This definition," the law states, "shall not be construed as prohibiting elsewhere in the stair-halls or entrance-halls, the use of wooden floorings on top of wooden sleepers; nor as prohibiting wooden handrails or treads of hardwood not less than two inches thick, nor doors or wooden lath in partitions."

The law definitely states that no closet of any kind, except one of fireproof construction, may be placed under a stairway leading from the first floor to an upper story. Such space must be left entirely open.

The environ interests of a standard the building inspector of each city, in case his other exists. It not, the local board of health is responsible for seeing that property owners conform to its requirements. In case the board of health cannot enforce the law, the city mayor is held responsible. The fire marshal is urging local officials everywhere, to take particular pains to see that the law is enforced.

Clyde Stump-Puller Bought for Siberia

The Russian government, through William P. Anderson, agricultural commissioner for America, has purchased a stump pulling and piling machine to be used in reclaiming land along the Amoor river in Siberia. The machine pulls, skids and piles all stumps, leaving the ground entirely clear and ready for immediate cultivation.

Mr. Anderson declares that the agricultural future of Siberia is almost beyond imagination; the country contains no less than one sixth of the total farm land of the world, the greater part of which remains uncleared. He compared the climate along the Amoor to that found in western Canada and announced that the Russian government has undertaken the work of clearing thousands of acres to be given to industrious Russians, with a view to settling the country with prosperous and independent farmers.

This first stump puller will be shipped within a few days, its arrival being anxiously awaited by the community for whom it is to work. The machine is similar to one now being operated on the lands of the Houston Oil Company at Kirbyville, Tex., which has proved decidedly successful under somewhat trying conditions, clearing an average of two and a half acres a day in yellow pine stumps with big tap roots. These Kirbyville lands have been cut-over for many years and in consequence the tops of the stumps are hadly rotted, making it necessary to dig for a hold around a main root in a great many pulls. But for this, the capacity of the machine would be even greater. However, this difficulty will not be encountered in the Siberian operations, since the timber has not yet been folled

These stump pullers are built by the Clyde Iron Works at their factory in Duluth, Minn.

Philippine Forestry Report

The annual report of the Philippine Burcau of Forestry, for the fiscal year ending June 30, 1913, has been published in Manila and copies Lave been received in this country. It was prepared by Major George P. Ahern, Director of Forestry. The public forests in the Philippines aggregate about 40,000,000 acres. The working force includes ten foresters and seventy-eight rangers and guards. Total expenses are \$227,000 a year, and the net income \$163,000.

One of the troubles which the Philippine foresters have to contend with is the activities of the squatter who clears land in the forest, destroys timber, and carries on crude agriculture without much concern about the real owner of the land. These clearings are called "caingins" -a name which is anything but English, but which, for some reason, the Philippine foresters persist in using instead of its English equivalent. They also use the measure "hectare" when they might express it in acres so that the American readers can tell what is meant without being under the necessity of consulting a dictionary and then working a sum in decimal fractions to translate the term into English. They likewise use an arbitrary sign for the dollar mark, or for whatever it is they use in place of American money. The American government has gone to considerable trouble and expense to send school teachers to the Philipuines to teach English to the people there. It seems a little inconsistent to do this, while American foresters over there show preference to what is not English in writing their reports.

Nevertheless, the report under review is an excellent one and gives a great deal of information concerning the forests of the Philippines

The Interchangeable Fixture Company of Grand Rapids, Mich., has been succeeded by the Grand Rapids Display Equipment Company.

It is reported from Hot Springs, Ark., that the A. J. Roads Furniture Company has been incorporated at that place with \$10,000 capital stock.

The Ahrenbeck Vehicle Company is the style of a recently incorporated concern at Navasota, Tex. The company's capital stock is

The Z. A. Ward Woodwork Company has started business at Pittstield. Mass. This is an incorporated concern and will operate with \$28,000 capital.

The Campbell Cur Company is the style of a recently incorporated concern which will operate at Rochester, N. Y. The company has an authorized capital of \$50,000.

It is reported from Fall River that Ernest C. Whitney, Salem, has incorporated under the name of Ernest C. Whitney, Inc., with an authorized capital of \$10,000.

It is also reported from Fall River, Mass., that the A. Homer Skinner Lumber Company, which has been a figure in the lumber trade of that city, has been succeeded by the Pope-Sisson Lumber Company.

R. L. Muse & Co., Walnut Ridge, Ark., will build a hardwood sawmill of 40,000 feet daily capacity. The building will be 150x50 feet and the entire plant will cost \$10,000. The machinery has already been nurchased.

------≺ CHICAGO >---

Thomas McFarland, prominent in hardwood circles of Cairo III., was one of the recent visitors to the Chicago market. Ira B. Bennett, president of the Fresno Flume & Lumber Company

of Fresno, Cal., was in Chicago for several days last week.

William H. Shippen of Shippen Brothers Lumber Company, Ellijay, Ga., spent last week with the local trade on business, George I. McClure of George I. McClure & Co., Buffalo, and Stephen

Derry, also of Buffalo, were two of the prominent out-of-town visitors last week. Sam A. Thompson, sales manager of the Norman Lumber Company,

Louisville, Ky., and Holly Ridge, La., has been in the city for several days of this week.

William M. Gunton & Co., hardwood dealers of Chicago, are involved in an involuntary petition in bankruptcy.

The Huddleston-Marsh Lumber Company, Chicago, has increased its capital stock to \$75,600. It is reported that the Williamson-Kuny Mill & Lumber Company,

Mound City, Ill., has been succeeded by P. T. Langan, with headquarters at Cairo, Ill. Thomas W. Fry, secretary of the Charles F. Luehrmann Hardwood

Lumber Company, St. Louis, Mo., spent several days of last week in the Chicago trade.

M. L. Pease of the Galloway-Pease Company, Saginaw, Mich., and Poplar Bluff, Mo., made one of his periodic visits to this city last week. J. T. McRoberts, secretary of the Hooton Hardwood Company of Terre Haute, Ind., was in Chicago last week in the interest of his concern.

George T. Burgess of Russe & Burgess, Inc., Memphis, Tenn., spent a few days in Chicago last week on business.

C. H. Donaldson of the Mason-Donaldson Lumber Company, Rhinelander, Wis., was a prominent northern visitor in the Chicago market several days of last week.

-----≺ NEW YORK ≻=

W. H. Alling, sales manager and H. L. Black, selling representative of Caffisch Brothers, hardwood manufacturers and wholesalers of Jamestown, were recent visitors in New York. They report a good inquiry but the volume of business being placed is still low for this season of the year. The company is making a big drive now on thick maple.

The local office of Hotchkiss Brothers Company, wholesaler, with main office at Torrington, Conn., has been discontinued. D. B. Collins represents the company in New Jersey and J. B. Huff covers the upper New

York state trade.

The Barker-Bond Lumber Company, wholesaler of pine and hardwoods, has engaged the services of Varney A. Randall, who will represent it in a selling capacity in the Long Island, New England and eastern Pennsylvania trade. He is a son of E. V. Randall, manager of the Goodyear Lumber Company's local office.

The Flume Lumber Company has been incorporated here by C. P. Folsom, L. H. Strouse and L. Goldstone, attorneys of 55 John street, who are known in the lumber trade of the district. The company will develop a hardwood tract in eastern Tennessee, where a mill has been placed. It will ship via Paint Rock, N. C.

W. S. Harlan of the Jackson Lumber Company, Lockhart, Ala., was a

Visitor in New York recently. He was one a four of the entering archets where Jackson flooring is so well known

R. J. Perrine president of the New York Lumber Trade Association has returned from a vacation spent at Palm Beach and other winter resorts. He met quite a company of local lumbermen at the Florida resort.

John W. Chandler, formerly sales manager of the Kirby Lumber Company at Houston, will take charge of the local office of the Kir v company April 1. He has seen succeeded at Houston by Harry T. Kindall.

— ✓ BUFFALO > — —

A. W. Kreinheder was re-elected president of the Buffalo Lumber Exchange on March 14. Hardwood men elected directors were: Elmer J. Sturm of Miller, Sturm & Miller; Hugh McLean of the Hugh McLean Lumber Company; W. A. Perrin of Blakeslee, Perrin & Darling; and A. E. Davenport of Davenport & Ridley. The exchange went on record as favoring the new commission charter for this city.

Vice-president O. E. Yeager states that the convention of the National Hardwood Lumber Association to be held here in June will doubtless draw a large and representative crowd from all over the country.

A. A. Mason reports a fair trade in hardwoods, with an especially good call for sap birch, which has been very scarce in this market recently, and also for manle

Messrs, McCallum and Plumley, of the Hugh McLean Lumber Company's executive force, have recently been in the South, calling at the com-

pany's mills and looking over the bardwood situation B. F. Ridley of Davenport & Ridley has lately been in Pennsylvania, where he has been shipping principally beech and white ash. The weather has been good this winter for logging.

The National Lumber Company, which has taken up the flooring trade extensively of late, finds that the market holds steady and that there is a fairly good demand for oak and maple chiefly.

The Buffalo Hardwood Lumber Company reports trade as fair this month. The company is not likely to get any lake lumber of account

down the lakes this season, owing to the high prices asked.

A. J. Elias was one of the chief speakers at the recent hearing before the mayor and spoke in favor of the signing by that official of the new charter for this city.

The Standard Hardwood Lumber Company reports the hardwood trade as looking up. A large number of cars of oak and chestnut are beginning to arrive from the South.

The Yeager Lumber Company finds trade fair this month, with inquiries on the increase. With better weather business is expected to improve considerably. Oak, maple, elm and basswood are moving.

Miller. Sturm & Miller state that the hardwood trade is covering a number of different woods at present, though maple and oak are the hardwoods in chief demand

T. Sullivan & Co. report an increased trade in beech and for this wood a better demand exists than for some time. Plain oak is not as strong in this market as a short time ago.

George A. Jackson of Jackson & Tindle, has bought a large residence lot on Oakland Place, in the best section of the city, and will build a handsome house there this summer.

=≺ PHILADELPHIA ≻=

A. S. McGaughan, the well-known lumberman and eastern representative of the Oregon Lumber Company, Baker City, Oregon, with headquarters at the Lumbermen's Exchange rooms, has just returned from a trip through Eastern Pennsylvania and New England. He was greatly encouraged over the outlook for New England.

J. W. Campbell of Currie & Campbell says things have been somewhat quiet of late due to the severe weather conditions, but with seasonable

weather he is confident things will swing round to normal.

Charles K. Parry of Charles K. Parry & Co., sole selling agents of the Carolina Spruce Company, Pensacola, N. C., reports desultory trading owing to the bad weather, but the recent mild conditions have had good results, as a number of good orders have already been booked. Business so far in March is considerably over the total for the whole month of March, 1913.

The Kendall Lumber Company of Pittsburgh has removed its Philadelphia branch office from the Real Estate Trust building to room 416 Crozer building.

William P. Shearer of Samuel H. Shearer & Sons says business bas been practically at a standstill, but as soon as good spring weather arrives he has no doubt business will revive. The mill at Atkinson, N. C., is active getting out stuff. Samuel H. Shearer has just returned from a short sojourn at Atlantic City, N. J.

Howard B. France, secretary and treasurer of the Haddock-France Lumber Company, reports the mill at Mt. Sterling, N. C., busy preparing for the first advance in trading. He says business has been fair right along, with low grades in strong demand. He is optimistic as to outlook,

William H. Fritz, vice-president of the Lumbermen's Exchange, and head of W. H. Fritz & Co., recently with his wife spent a few weeks at Palm Beach, Fla. The trip was made mainly for the benefit of Mrs. Fritz, who has been in frail health for some time.

Arthur W. Kent of the J. S. Kent Company reports business only fair, but looks for more buoyant trading with the return of good weather.

Walnut for Export

A lot of splendid assorted **American Walnut** logs, squared up and ready for export, are shown in the above photograph, which illustrates a section of our exporting yard at Kansas City.

All work, from the selecting of the trees in the woods to the final loading, is done by men trained in our employ and is under our close personal supervision.

Hence we can guarantee satisfaction in both export and domestic shipments,

FRANK PURCELL Kansas City, Mo. U. S. A.

VENEERS

Your profits depend largely on economical production, and uniformly cut veneers lessen the cost of production.

Our employes are experienced, our machinery modern, and we use the best selected logs in Mahogany, Circassian Walnut and Quartered Oak.

Therefore, we will furnish you with absolutely uniform and bone dry sliced or sawed veneers that your men can handle with a minimum outlay of time and labor.

This Means Money in Your Pocket

We will welcome you to our plant (which is so modern it's worth coming to see) or we will send a representative with samples, on request.

Fred W. Black Lumber Co.
2245 S. Crawford Ave. Chicago, Ill.

Volney G, Bennett, an old and well-known lumberman, and father of Killem E, Bennett of Mungar & Bennett, Canden, N. J., died on March 14, in his seventy seventh year,

A report has come that the head, arms and body of William Balliet, a wenithy lumberman of Williamsport, Pa., were found along the Lackawanna Raliroad, at Shickshinny. The county authorites are convinced that Balliet was robbed, murdered and thrown upon the track, for further mutilation. A gold watch and chain, \$200 in cash and other valuables which are known to have been in his possession, are missing.

J. H. Sykes, formerly Philadelphia representative of W. A. Wilson & Sons, Wheeling, W. Va., has formed the J. H. Sykes Lumber Company, and will handle the Wilson product in this territory.

----≺ BOSTON >--

I following the withdrawal from the Larivee Lumber Company of Cyril J. Larivee, as noted in a recent issue, this firm has changed its name to the B. L. Tim Lumber Company. Its yard will remain at 516 Albany St., Boston, with B. L. Tim president and S. Hirsch, treasurer.

The old firm of M. F. Ashley & Co. of Attleboro has dissolved partnership, and Edward G. Ashley will continue under the old style as proprietor.

The Wm. Keller Construction Company has been incorporated at West Newton, Mass., with capital stock of \$50,000, and will operate a large planing mill in that town.

John B. Bugbee of the hardwood house of the Holt & Bugbee Company is now able to be at the office a few hours each day after a prolonged illness during the winter.

T. A. Foley of Paris, Ill., called on the trade of Boston during the present week.

← BALTIMORE >

Richard P. Baer, of Richard P. Baer & Co., the well-known hardwood firm in the tower of the Maryland Casualty building, is back from a trip of several weeks down South. He went from Baltimore to Asheville, where he looked after details in the branch office, and continued to Mobile, near which city the firm operates a mill, and thence to New Orleans. He found business in the main quiet, with the demand holding off to a pronounced degree, but with the feeling as to the future rather encouraging. M. S. Baer, of the same firm, has gone on a trip to the Middle West. He will stop among other places at Columbus, O., where the firm maintains a branch office with E. C. Williamson in charge. It is also Mr. Baer's intention to visit a number of other cities in that territory, seeing for himself just how the hardwoods are moving.

A. Frank Parker of Mann & Parker, Inc., Continental building, spent a day at the home office this week, but was off again (or Pennsylvania and adjacent territory, and is not expected to return for a month or more. He reported while here that a considerable portion of the northern territory was slow about taking up lumber, and that New York in particular was decidedly quiet.

Among the visiting lumbermen here during the last ten days or two weeks were J. Rappe Myers, Jr., of the Ellis & Myers Lumber Company, Salem, Va.; J. H. Mackleduff of the Case-Fowler Lumber Company, Macon, Ga.; F. E. Schofield of Schofield Bros., Philadelphia, and G. C. Adams, of the Duquesne Lumber Company, Pittsburgh, Pa. All reported that the hardwood trade had been rather quiet of late, with prices in the main easy, and much trouble experienced on account of deep snow and other obstacles.

Unusual activity in the placing of bark contracts in West Virginia and Pennsylvania, in the neighborhood of Cumberland, which attracted attention of late, has been followed by the report that the Chicago packing firm of Swift & Co. has acquired tanneries in that section and will tan the hides produced by it.

The schooner Benjamin F. Poole, a four-master, which sailed from Wilmington, N. C., for Baltimore, January 20, with railroad ties has been given up for lost. She carried a crew of eight men besides the captain. Nothing has been heard from her since she left Wilmington.

That the lumber trade in so far as Baltimore is concerned, is very good with excellent prospects, at least in so far as quantity is concerned, appears plainly from the report of the building inspector for February, which shows that the month ran about 160 per cent abead of the corresponding period of 1913. The total for the first two months of the present year was not less than \$2,610,774, with \$1,581,855 for February alone. Only the most active months of 1913 equalled or approached this record, a continuance of which will put 1914 far ahead of any year with the single exception of the first year after the great fire, when construction work was unusually active.

The steamship Quernmore, of the Johnston line, which arrived ten days ago from Liverpool, brought nearly 200 mahogany logs from Africa. Practically the entire shipment was destined to points West, a large number going to St. Louis.

----≺ COLUMBUS ≻=

Papers have been filed with the secretary of state increasing the capital stock of the H. G. Coffman Lumber Company of Washington C. H., O., from \$75,000 to \$100,000.

The Ervin-Finley Mill and Lumber Company of Hamilton has been

incorporated with a capital of 810,000 to do a general himset busine by C. A. Ervin, I. S. Finley, Edward Weber, S. D. Mayer and H. R. Relgart. The company was formerly operated as a partnership and is located at 129 North B. street

The McKenzie Lunder and Coat Company of Springfield, O. has incorporated three concerns to bandle the lumber and outling supply business in three separate towns. The Springfield company is to be known as the McKenzie Lumber and Coul Company. The company at Delaware, O., is called the McKenzie Lumber Company and the one at Waldo, O., the McKenzle Lumber and Timber Company. ors in each of the companies are William McKenzie, John S. McKenzie, Frank E. McKenzie, C. W. McKenzie and Presley H. Saib.

The announcement is made that the Crescent Lumber Company, which has had its general offices at Marietta, O., for a number of years, will remove to Lexington, Ky. The company has extensive interests in Kentucky and West Virginia.

The Trimble Cypress Company of Cincinnati has purchased a sawmill at Robinwood, Miss., which will be operated from the Cincinnati office.

J. W. Campbell has been appointed receiver for the Ira King Lumber Company of Sardinia, O., upon the application of creditors who claim the corporation is insolvent.

At Warren, O., the Culver Lumber and Building Company has opened in the wholesale business recently.

The Scott Lumber Company of Martins Ferry, O., has purchased the stock of the H. M. Rothermund Company of the same place, and will consolidate the two yards.

R. W. Horton, sales manager for the central division of the W. M. Ritter Lumber Company, says trade in hardwoods has been quite active during the past fortnight. Yards are probably the better customers at Factories are also buying better and furniture concerns are now in the market. The price list is generally well maintained and no cutting of prices is being done to force trade. Shipments are coming out better. Hardwood stocks in the hands of mill owners are not large and the same is true of retailers' stocks.

John R. Gobey of John R. Gobey & Co. says trade in hardwoods is all that could be expected under the circumstances. There is a good demand for all varieties and grades and prices are generally upheld. The prospects for the future are good.

J. A. Ford of the Imperial Lumber Company reports an improvement in the hardwood trade all along the line with shipments coming out better now.

Manager Hodil of the Virginia Lumber Company is another of the hardwood jobbers who believes there will be a marked improvement in the hardwood demand in the near future.

The Gilliam Process Company of Columbus has been incorporated with a capital of \$10,000 to deal in lumber by C. G. Thompson, R. L. Gilliam, H. H. Davis, C. W. Thompson and J. Teegardin,

A loss of \$15,000 was caused to the plant of the Defiance Box Company of Defiance. O., by fire recently,

The Akron Lumber Company of Akron has been incorporated with a capital of \$125,000 by John H. Dellenberger, H. A. Dellenberger, John H. Dellenberger, Jr., and David H. Morgan.

——≺ INDIANAPOLIS ≻——

The Montgomery Hardwood Lumber Company, Crawfordsville, has notified the secretary of state it has dissolved its corporation.

A modern factory building is to be erected immediately by the newly organized National Gate Company at Rushville.

Notice of a change in name of the Adams-Carr Company to the Adams-Rogers Company has been filed with the secretary of state.

Creditors of the Laporte Cabinet and Molding Company, Laporte, bave filed a petition in the United States Court in this city asking that the company be adjudged bankrupt.

The Lyman Brothers Company, manufacturer of picture frames and moldings, lost its plant in east Ohio street by fire on the night of Marsh 12. The loss was about \$35,000 with \$18,000 insurance. The plant was a new one, having been occupied last summer.

In an opinion handed down recently, the Indiana Supreme Court held that the employers liability law of 1911, which does away with the fellow-servants' rule as a defense where there are more than five employes, is constitutional. This law also does away with contributory negligence as a defense in many cases. The decision was of special interest to every employer of labor in the state.

O. D. Haskett of the O. D. Haskett Lumber Company, who was recently elected president of the Indianapolis Chamber of Commerce, has announced his committee appointments, which include many identified with lumber interests. W. W. Knight of the Long-Knight Lumber Company has been placed on the committee on arbitration and street and sewer improvements; H. C. Atkins of E. C. Atkins & Co, on the advisory, emergency, relief, membership and track elevation committee; Caleb S. Eaglesfield of the Eaglesfield-Stewart Company on the committee on municipal expenditures; Nelson A. Gladding of E. C. Atkins & Co. on the committee on municipal expenditures; John H. Talge of the Talge Mahogany Company on the committee on state and national legislation; L. H. Griswold, a lumber broker and M. S. Huey of the Capitol Lumber Company on the committee on good roads; T. R. Lewis of the Burnet-Lewis

Lumber Company on the finance company; H. B. Burnet of the Burnet-Lewis Lumber Company, and S. P. Matthews of the South Arkansas Lumher Company on the committee on relief and charities.

After a three months' tour of Europe, Mr. and Mrs. Paul Brown and Mrs. Brown's sister. Miss from Talge, have returned home. Mr. Brown went to Africa hast spring to buy mahogany logs for the Talge Mahogany Company of this city and upon arriving in England last December, was joined by Mrs. Brown and Miss Talge.

— ≺ MEMPHIS >=

The band mill of the Gayoso Lumber Company, heated in South Memphis, has begun operations. This plant was purchased from the Fair Lumber Company in Mississippi but was used very little and is practically as good as new. It has a daily capacity of from 45,000 to 50,000 feet of lumber. The firm owns a large amount of timber in north Mississippi and the mill will be used to convert this into lumber. The sawing has heretofore been done by custom mills. C. R. and W. A. Ransom are the principal owners of the Gayoso Lumber Company.

C. B. Dudley of the Dudley Lumber Company has returned from New Orleans where he has been looking after the establishment of yards. The Dudley Lumber Company has a large contract for ash abroad and the lumber will be concentrated at New Orleans, from which port it will be sent abroad. The yards are to be used to facilitate this business.

Frank B. Robertson of the Anderson-Tully Company and W. H. Russe of Russe & Burgess, Inc., have returned from New Orleans also. They went there, together with Ben Johnson of the Mansfield Hardwood Lumber Company, Shreveport, Lu., as a committee of the National Lumber Exporters' Association for the purpose of protesting against the practice on the part of the steamship companies of taking rubber stamps and endorsing bills of lading with the words "stained," "weather stained," ct. The committee pointed out that these endorsements not only reduced the value of bills of lading on lumber cargoes as negotiable documents but likewise hurt the shipper through the creation of a wrong impression in the mind of the recipient of the ladings. No formal report has yet been made to the association and nothing will be given out about the conference until this has been done.

Commissioner Dies, who, as a member of the government of this city, is in charge of public utilities, has refused to accept an ordinance tendered by the insurance men here providing for the elimination of wooden shingles as a house covering within the city limits. The insurance men contend that the continued use of wooden shingles will some day result in a vast conflagration, but Mr. Dies insists that it would be an unnecessary and undesirable handicap to impose upon builders of homes the use of slate, metal or other covering than wood. There are a number of men here who are engaged either in the manufacture or sale of cypress shingles and they are very much pleased with the efforts of Cammissioner Dies to prevent the adoption of an ordinance providing for complete substitution in this matter.

Owners of sawmill establishments and hardwood yards in North Memphis are congratulating themselves upon the closing of a contract between the Illinois Central system and the city of Memphis whereby a levee is to be built in the northern part of Memphis. Heavy loss has been experienced during the floods of the past two years through the stoppage of plants, the overflow of lumber and the cutting off of transportation facilities in the North Memphis lumber district and much pleasure is expressed over the fact that such recurrences are to be made impossible even during high water in Mississippi and Wolf rivers.

G. W. Wade of the Trenton Land Company, Trenton, Tenn., and R. S. Harlan of Corinth, Miss., have purchased 2,883 acres of bardwood dimberlands in West Carroll parish, north Louisiana, near Oak Grove. R. H. Fitzgerald was also interested in the transaction. It is understood that plans will be formulated at an early date for the establishment of a mill for the development of the timber on this property.

The hardwood lumber industry at Memphis, as well as the various woodworking enterprises of this city, will be well represented at the forthcoming annual of the Tennessee Manufacturers' Association. This will be held at Nashville, April 8 and 9. Memphis boasts three of the principal officers of this body, J. T. Willingham, president of the Memphis Coffin Company, is president, S. B. Anderson, head of the Anderson-Tully Company, Memphis, is vice-president, and T. R. Winfield, president of the Cole Manufacturing Company, is tressurer. All of these gentlemen will attend in their official capacity while a number of other prominent manufacturers will attend as delegates. There is a branch of the Tennessee Manufacturers' Association here, known as the Memphis Manufacturers' Association, and a number of lumbermen are identified therewith

Dispatches from Paducah, Ky., indicate that the Illinois Central will, about July 1, begin work on the enlargement of its shops at Memphis and that these will be of such dimensions that employment will be given to about 3,000 men. It is pointed out that practically all of the car repairing of the southern lines of the system will be done at Memphis and that all repair work of every kind for the southern lines will be done at Memphis and Paducah.

Building operations in Memphis for February showed an increase of thirty-three per cent over the corresponding month last year. There was a substantial gain in January, with the result that the total increase since the first of the year has been quite full. The weather is quite open and the outbook is considered a steady favorable for large operations along this line. Bullders, contractors and handlers of materials of all kinds are making preparations for an active business.

John M. Pritchard, secretary of the Gum Lumber Manufacturers' Association, is authority for the statement that there has recently been a decided increase in the number of repairs for red gum. He also says that some of these are leading to business and that there is more of this lumber moving now than has been the case for quite a while. The association has been very active since it was organized a few months ago and its campaign of education in behalf of red gum is beginning to awaken considerable interest in this lumber. Mr. Pritchard expresses bimself as very much encouraged over the outlook.

There has been very little rise in the Mississippi recently and later advices from the government suggest that there may be no recurrence this year of the spring flood. It is pointed out that the area of snow in the upper tributaries is rather smaller than usual and there has been also comparatively little rainfall recently in the Ohio, Mississippi and Missouri river valleys. There is still time enough for an overflow but lumber interests here are rather inclined to the view that there will be no disturoance along this line this season. They are glad of this and emphasize the fact that, after having had three overflows in two years, they are entitled to surcease from this particular trouble. A higher stage than the present one would be welcome because of the bearing it would have on the log supply. The present volume of water is not large enough to facilitate the handling of timber by that method and millmen who depend on water transportation are hopeful that there may be a materially higher stage without in any way interfering with lumber interests throughout the Valley states.

— ≺ LOUISVILLE > —

Members of the local hardwood trade are much pleased with the result of the decision by the Interstate Converse Conmission in the complaint of the Norman Lumber Company and others against the Louisville & Nashville Railroad Company and others, whereby discrimination is held by the commission to have been practiced by the roads in regard to the bridge toll across the Obio, and a change of the situation in this respect is ordered. The situation is unusual. Louisville, being on the south bank of the Ohio, has had no toll to pay on inbound shipments from the South; but the railroads have absorbed the charge in shipments to cities on the north bank, such as Cincinnati, whereas the northern carriers, in hauling lumber from Louisville into central and eastern territories, have applied the charge, the north-bank cities thus being favored to the extent of the one-cent bridge toll absorbed by the southern carriers. The commission says that either the carriers must shrink the bridge toll on outbound shipments at Louisville or charge it on inbound shipments at Cincinnati. The case has been before the commission for some time, being the outgrowth of the original complaint filed several years ago. J. Van Norman, the local attorney, who is a son of A. E. Norman, president of the Norman Lumber Company, conducted the case and brought it to a successful conclusion.

The Kentucky legislature has completed its session and adjourned, little regret being expressed, though the legislature left undone a great many important things. The lumbermen were particularly anxious to have the tax system amended, but the legislature adjourned without authorizing a vote on a constitutional amendment on this subject. The most important legislation put through included a workmen's compensation bill and a fire insurance bill, the latter of which was so drastic in its provisions that it has driven most of the fire insurance companies from the state. The compensation measure provides a state insurance fund, but makes it optional with the employer as to whether he will insure with the state or pay premiums to a stock company. The schedule of compensation is fifty per cent of the workmen's weekly wage in case of injury, and \$3,750 for death. The measure was put over as the result of a combination of efforts of the coal operators and labor unions, the former, on account of the high liability rates, desiring a state insurance fund. Some manufacturers have objected to it on various grounds, and it is possible that it will be declared unconstitutional.

Improvement in the demand for chestnut has been one of the interesting developments of the month. Ash is also holding up well, and there has been a good demand for quartered oak. Plain oak is likely to pick up considerably as soon as the interior trim manufacturers settle down to the active business of the building season, which has not opened up as yet on account of thad weather all over the country.

It is rumored that another hardwood company may be formed in Louisville. There is no definite information on the subject as yet, but according to reports which have been in circulation the deal may involve a reorganization of two companies now in the business. The local market has been expanding of late, and the addition of another aggressive company would be welcomed.

The Richiand Parish Lumber Company of Louisville, which has a large sawmill at Rayville, La., generally believed to be one of the most modern plants in the country, has increased its capital stock from \$400,000 to \$700,000. The company plans to buy additional timberland in the vicins ity of Rayville. Charles C. Mengel, Jr., is secretary of the company

The Federal Parquetry Manufacturing Company, which was recently incorporated at Quicksand, Ky., with \$100,000 capital stock, will have a plant in Lexington, Ky., having leased the old Luigart planning mill. It will operate special machines imported from Europe for the purpose, it

THE GLUE THAT IS APPLIED COLD -

In Flush Veneered Doors

The chief consideration is uniformly highgrade glue. Manufacturers of this modern type of door realize that its development has been retarded because the unavoidable lack of uniformity in other types of glue makes it impossible to know how long a door will stay in condition. The

Of vegetable glue insures absolute uniformity because of the very nature of preparing it and because every pound of our raw material is rigidly inspected.

Vegetable Glue

Is also a rigid and permanent adherent; will not blister in sanding; has no disagreeable odor; will not deteriorate in standing-for a week if necessary; and can be applied cold without any heating application of any kind in the glue room. In addition, the average saving over former glue bills has been twenty per cent where vegetable glue is used.

A DOOR MAKER SAYS:

Tacoma, Washington, U. S. A., Sept. 23, 1918.

Perkins Glue Company,
South Bend, Indiana.

Gentlemen: The convenience and economy of the
use of Perkins vegetable glue, its uniformity and the
satisfactory results we have obtained, together with
the courtesy we have been uniformly shown by the
officers and representatives of the company, prompt
us to express in this way our appreciation of the
Perkins Glue Company and its products.

Yours very truly,
THE WHEELER, OSGOOD COMPANY,

THE GLUE THAT RUNS ABSOLUTELY UNIFORM

is said. I. Herz, who has been running a sawnill at Quicksand, is to be the active manager of the company, the officers of which are New York men. The company hopes to be able to use a large amount of sawmill waste in its operations,

Bond Brothers, leading timber and tie dealers of Elizabethtown, Kv. have announced that their capitalization will be increased from \$150,000 to \$200,000. The company operates in Kentucky and Tennessee and is one of the largest handlers of ties in this part of the country.

The Paducah, Ky., Board of Trade has won a case before the Interstate Commerce Commission, in which it is held that the town is entitled to a lower rate than Cairo, Ill., on shipments from equi-distant points in the South by reason of its location on the south bank of the river. The commission holds that carriers should either charge bridge tolls on traffic in both directions at every competitive crossing of the Ohio river or not charge it at any crossing.

---≺ NASHVILLE **>**--

At the annual meeting of the Nashville Lumbermen's Club the following officers were elected: Henderson Baker, president; C. E. Hunt, vicepresident; Cecil Ewing, secretary, and Harold Greene, treasurer. Secretary Ewing made an interesting report on the past year. Two new members were enrolled, H. A. McCowen & Co. and the Ever Ready Lumber Company,

The Commercial Club of Nashville is a new organization that has been effected by consolidation of two old commercial bodies, with over 1,800 Arthur B. Ransom, one of the leading hardwood manufacturers of the South, was elected president. The hardwood lumber interests are well represented in the new organization, Hamilton Love and Charles M. Morford, former presidents of the Nashville Lumbermen's Club, being

The Standard Furniture Company reports fine conditions in the furniture trade. It has been steadily increasing its output, and has one of the largest furniture factories in this section.

W. V. and N. N. Davidson, prominent local manufacturers, have gone to Florida for a visit of a few weeks.

Forest fires are reported to have caused damage to timberlands in Cheatham County, but have been extinguished by rain.

W. H. Russe of Russe & Burgess, Inc., Memphis, was in Nashville and spoke of foreign trade as disappointing. His firm's business is principally export trade.

Dr. A. H. Purdue, state geologist, has issued an interesting bulletin, which goes to show that yellow poplar can be profitably grown in Tennessee. This will be of interest in view of the large cut of yellow poplar in Tennessee in the past years, this being one of the most important states for this line.

The Nashville Tie Company of Nashville, Harris Tie Company of Erin. Tenn., and Ohio Valley Tie Company of Louisville have filed complaints with the Interstate Commerce Commission against the Louisville & Nashville railroad, seeking to secure a suspension of an increase of from one to two cents per 100 pounds in the rate on crossties from middle and west Tennessee. The tie business handled by complainants consists of ties made largely of waste timber, and the ties are treated chemically with preservatives to make them durable. Complainants have built up a large tie business in this section, handling several millions of ties annually. The railroad has recently built a treating plant at Guthrie, Ky., and it is claimed by petitioners that its opposition to the removal of crossties from the territory of its line is the cause of raising the rates. Petitioners state that but for the business developed by them their use would be practically lost, as they take what is left after the choice logs have been removed for other purposes.

The city of Nashville has filed a complaint with the Interstate Commerce Commission seeking to secure reasonable reciprocal switching charges between the Louisville & Nashville and Tennessee Central railroads. Commissioner Myer will hear evidence in the case March 25.

Fred Arn of Chattanooga, president of the National Lumber Exporters' Association, was a recent visitor in Nashville. In talking of the export trade Mr. Arn deprecated the action of some lumber manufacturers in shipping to foreign countries on consignment, saying he found that under present conditions it is better to sell at home than to ship to other countries on consignment.

=-< ST. LOUIS >-=

The new federal reserve system was explained in detail by $W.\ M_{\text{c}}M_{\text{c}}$ Martin, trust officer of the Mississippi Valley Trust Company, at the regular monthly dinner and business meeting of the Lumbermen's Club of St. Louis, held at the City Club, Tuesday evening, March 10. Mr. Martin gave a splendid talk and the lumbermen who were fortunate enough to be present understood the subject thoroughly after he had finished. usual dinner was served at 6:30.

In the absence of John Reheis, the president of the club, C. G. Schilling, second vice-president, presided. Immediately after the dinner Mr. Martin gave his talk and the business meeting followed. Six new members were elected-Raymond Irvin, Harry R. Asman, Henry Schaefer, Robert Kamm, A. H. Beardsley and Harry Montgomery. A report on the five per cent freight rate advance was suggested, cut after considerable discussion action on the report was postponed until a later meeting

W. W. Dings of the Garetson-Greason Laumber Company is out West on a selling trip. He spent several days in Kansas City and then went to Denver. Before leaving the city he stated there was a fair volume of business being done, but hardly as much as there would be had the weather been pleasant. Their mills, with the exception of the one at Wasson, Ark., were running all right. Wet weather at the Wasson mill prevented logging and it had to close down until the woods dried out so they could get logs.

The C. F. Liebke Hardwood Mill & Lumber Company is running right along sawing timber. It is getting in logs by rail almost every day and is sawing them as fast as possible in order to fill the big lot of orders it has on its books. The company has enough now to last it for several

Henry Boeckeler of the Boeckeler Lumber Company reports quite a lively trude at the yard. The company has a number of big orders, one of them calling for 700,000 feet and another for 100,000 feet. These, with a big order obtained by Mr. Boeckeler when he was over in Ohio a short time ago, which amounted to 1,100,000 feet, is keeping it busy. William Boeckeler, who has been at French Lick Springs for the past two weeks, is home feeling much better than he did.

E. W. Blumer, sales manager of the Lothman Cypress Company, has been at home on the sick list for several days. On his way home from the Central Iowa Retail Lumber Dealers' Association meeting at Des Moines, his train was held up by a big snowdrift and he was tied up for a couple of days. He caught a severe cold, which resulted in his being compelled to give up business until he recovered,

Thomas E. Powe of the Powe Lumber Company, who has been in the South on a pleasure trip for several weeks, is back home. He said he found conditions much better than he expected. He is looking for a lively spring trade as soon as the weather clears up and building operations can commence.

John F. Rutherford, son of the late John F. Rutherford of the old Bluff City Lumber Company, Pine Bluff, Ark., is associated with the R. M. Morris Lumber Company of this city as a salesman.

—≺ ARKANSAS ≻=

The Pekin Stave Mill at Pekin, a small town on the Jonesboro, Lake City & Eastern Railroad, near Jonesboro, Ark., was destroyed by fire on March 10. The loss was about \$4,000, with no insurance. The fire is supposed to have been caused by a spark from the smokestack. This plant employed about forty five men. The plant will likely be rebuilt.

The Cotton Plant Handle Company of Cotton Plant, Ark., filed articles of incorporation with the secretary of state of Arkansas on March 14. The authorized capital stock of the company is \$6,000.

On March 13 articles of incorporation were filed in the office of secretary of state by the Mountain Creek Timber Company of St. Paul. The Incorporators of the new company are L. P. Matthews, Charles Gilstrap and S. J. Campbell. The capital stock is placed at \$4,000.

The Whelen Land Company, with a capital stock of \$50,000, and the Whelen Lumber Company, with a capital stock of \$10,000, filed articles of incorporation with the secretary of state on March 12. Moses Stener is president of the land company and Z. D. Sparkman is president of the lumber company.

Two trees of unusual size were cut on the land belonging to J. D. Reynolds near Camden, Ark., last week. One, a gum, scaled 6,300 feet, and the other, a white oak, scaled 3,800 feet. Mr. Reynolds is a timber dealer and real estate man of Camden.

J. A. Reynolds, who for the past seven years has operated a shingle mill in the vicinity of Perry, Ark., is moving his plant to Sherrill, Ark. Mr. Reynolds recently purchased a large tract of cypress timber near Sherrill and will manufacture the same into shingles. It is estimated that the amount of timber standing on the land purchased will be sufficient to run Mr. Reynolds' plant for a period of six years.

C. L. Goodwin of Greensboro, Pa., has recently bought 15,069 acres of timberland in White county, Arkansas, lying along the banks of the White river. The purchase price was \$151,000. The land is covered with

gum, red oak, white oak, cypress and hickory timber.

Ed Huff, who has been buying walnut logs in the vicinity of Norfolk, on the upper North Fork river, for the past year, recently sustained a severe loss. While attempting to drive several hundred logs down the river the drive was caught in a big rise and the logs scattered along the river and caught on shoals and islands. The logs in the drive were very valuable and, although they can all be recovered, the expense to Mr. Huff will be great.

The Prescott Stave and Heading Company is moving its plant from Prescott, Ark., to Dearborn, Tex., where the company has recently purchased 50,000,000 feet of white oak timber. S. W. Foster is manager of the company and will move his family to Texas.

The Kennedy Heading Company is preparing a right of way for the building of a spur of the Pine Bluff & Arkansas River Railroad from Lankford to its plant near Hagler. This line will pass through a very heavily timbered hardwood belt.

The Fee-Crayton Hardwood Lumber Company of Dermott is planning a five-mile road in Chicot county to connect with the Iron Mountain at Chicot. The material for operating the road has been leased from the Iron Mountain.

---> WISCONSIN ≺---

The Crocker Chair Compeny of Storogen has filed an according to its articles of incorporation increasing its capital stock from \$500,000 to \$1,000,000. According to E. A. Zundel of the firm, no immediate changes or enlargements are contemplated and the increase is merely in the course of regular business

A new woodworking plant is to be added to the industries of Grand Rapids, Wis. The Weinberg Construction Company of that city is contemplating erecting a plant for the manufacture of sash, doors and interior finishing goods. A site has been selected on the Soo line for a \$25 000 factory

Several additions have been made by the C. D. Clarke Lumber Company of Merrill which will result in the further expansion of its business. addition to erecting enclosed sheds, which also contain comfortable workrooms, a planing mill has been installed and equipped with a rip saw, matcher, sander and other machinery. This concern is finding a ready market for quarter sawed oak table tops and legs and like products. The Clarke lumber piler, an invention of Mr. Clark, is also still being manufactured.

With the completion of the installation of a new engine and boiler, the Brillion Lumber Company of Brillion has started sawing operations at its mill in that city. A large supply of logs is on hand in the yards and will keep the mill running for some time.

Business men of Chippewa Falls are using their best endeavors and influence to secure the rebuilding of one of its largest industries, the plant of the Northwood Furniture Company, destroyed by fire February 26. According to J. E. Poznanski, secretary and treasurer of the concern, it is very likely that the plant will be rebulit on the same site. Definite action, however, will not be taken until the meeting of the directors as soon as the insurance adjustment has been made. The loss of the plant was in the neighborhood of \$65,000, on which there was a blanket insurance of eighty per cent.

The Capitol City Lumber Company has filed articles of incorporation with the secretary of state. It will establish offices at South Madison. The capital stock is \$25,000, and the incorporators are A. G. Banting of Madison, D. E. Kelley and G. I. O. Banting of Stoughton.

Fire caused a loss of \$50,000 on March 11, when flames destroyed the roundhouse, machine and blacksmith sheps and water tank of the Superior

& Southeastern Railroad at Grand View. The Willow River Lumber Company, which owns the road and the destroyed property, makes its logging headquarters at that place. Other property of the lumber company was saved by the aid of a locomotive, fitted with a syphon. The loss is partially covered by insurance.

The large general store and warehouse owned by the Connor Lumber and Land Company of Marshfield, and located at Laona, Forrest county, was destroyed by fire on the morning of March 13. The new hotel re cently erected by W. D. Connor, and located nearby, was also damaged. The loss is placed at \$50,000.

The Menasha Wooden Ware Company of Menasha suffered a total loss to its sawmill at Ladysmith from fire originating in the boiler room of the plant. The fire started at 10 o'clock in the evening and burned until 2 o'clock in the morning. The plant was valued at \$25,000, covered by insurance. The company will rebuild,

A jury in Judge Ludwig's court in Milwaukee has decided that the bunks in Camp 14 of Senator Isaac Stephenson's lumber company in Delta county, Michigan, were rainproof, and held that R. W. Bird was not entitled to damages for rheumatism that he alleged he suffered as a result of rain coming through the roof upon his bunk. It was held that what Bird thought was rain was moisture collected on the ceiling of the cabin. and found that he might have moved to another bunk.

Due to the fact that lumbermen in northern Wisconsin are being delayed in their work of unloading cars, division officials of the Milwaukee road at Green Bay fear a shortage of freight cars. While it was freely predicted early in the season that logging operations would be greatly hampered by the scarcity of snow, railroad reports show that more logs have been handled up to the present time than during the entire season

W. J. Kershaw of Milwaukee was given a hearing recently by the joint congressional commission to investigate Indian affairs in Washington on conditions in the Tioga Indian reservation in Wisconsin. Mr. Kershaw told the commission that nearly half of the \$3,000,000 trust fund on the Indians has been expended and that extravagance prevails in the operation of the lumber mills of the reservation.

Charles F. Hase, 3226 Highland boulevard, Milwaukee, vice-president of the Hilty Lumber Company, and interested in other prominent business enterprises of this city, died Tuesday evening, March 17, in Milwaukee Hospital, following an illness of a week. Mr. Hase was forty-four years old and a native of Milwaukee. He began his business career with the Second Ward Savings Bank, with which he was identified for sixteen years. Mr. Hase is survived by his wife, two children, his parents and three brothers.

C. W. Behnke, who established the first sawmill in Manitowoc county. and for many years conducted a lumber business at Rockland with his brother Albert under the style of Behnke Bros., died at Sheboygan from an attack of heart failure at the age of sixty-seven years. Mr. Behnke was for years a well-known banker and capitalist of Brillion, where the interment took place. He is survived by his wife and three children.

The Northern Hemlock and Hardwood Manufacturer's Association was represented by Secretary R. S. Kellogg at the recent hearing before Examiner Berry of the Interstate Commerce Commission at Minneapolis, when evidence was taken in a case brought by lumber manufacturers against railroads, charging discriminating and extortionate freight rates. The case is based on a joint complaint made by the Northern Hemlock and Hardwood Manufacturers' Association, the Northern Pine Manufacturers' Association and the Northwestern Cedarmen's Association. These associations claim that the freight rates from the lake points to Missouri River points are discriminating and extortionate and urge that they be ordered reduced. Under the rates in force, and which are protested against, it is stated that practically no lumber has been shipped from the lake states to Omaha, Neb., and other Missouri River points for some time because the freight rates are prohibitive.

The Kellogg Lumber Company of Antigo has formed an auxiliary organization, the Kellogg Supply Company, and has established offices at Wabeno, in charge of T. A. Richardson. H. B. Kellogg is president; T. B. Kellogg, vice-president; W. D. O'Neal, secretary and sales manager, and G. W. Dakin, treasurer. The Kellogg Supply Company will do a wholesale business in crating lumber, cordwood, slabs and pulpwood.

The Forest Products Company, a Minnesota corporation with \$159,400 capital stock, has filed a statement with the secretary of state to do business in Wisconsin. The investment in this state is \$40,000.

A hearing on the complaint of the Webber Manufacturing Company of Superior against the Northwestern and Northern Pacific railroads, seeking a reduction in the rate on logs from Van Buskirk and Carsons, Wis., to Superior by way of Ashland, was held at Superior by Halfort Erickson of the Wisconsin Railroad Commission. The complainant seeks to have a rate of ten cents cut to three or four cents per 100 pounds and other rates reduced proportionately. It was brought out at the hearing that logs from the stations involved in the complaint are being shipped south a greater distance than to Superior, about 125 miles, at the rate sought for this city, with the result that lumber and furniture are being made elsewhere out of logs taken from natural territory of Superior, which prohibitive rates make it impossible for local concerns to enter. Sheboygan, Stevens Point and Grand Rapids were among the cities mentioned as benefiting by the alleged discrimination. The two railroads have never had a through rate, and, until the complaint was filed in this case, declined to make one. An offer of a rate of about 51/2 cents, made to the

Webster company after the railroad commission had been appealed to, was refused as still too high compared with rates from the same territory on other lines.

The Upham Lumber Company of Marshhol reports a cut of a out six million feet during the passing season, and has started up the mills to manufacture the logs into lumber. The main logging operations of this concern are at Ogema. As that section is rapidly being settled, considcompany has had a very satisfactory winter's work at Stratford and Laona, probably as good as it has had for years. The mills at both places are running full time. Lumbermen seem well satisfied generally with the winter's logging operations. Although the snow came rather later there was a good road bottom and the snow fall was just enough to make short work of bauling from the skidways. Practically all logs cut this winter are now out of the woods on rollways. For the short time the snow lasted it is said that there was never a winter in upper Wisconsin when more hauling was done. At the present time the camps are rapidly being deserted, and men and teams are coming south from the woods. Sawmills and planing mills are being started up, and with the present demand for lumber and building material the outlook for a ready trarket at good prices is encouraging

The Milwaukee Lumbermen's Supply Company of Milwaukee has been Incorporated with \$12,000 capital stock. The incorporators are C. G. Forster, Charles A. Miller and E. Jurgens.

The Hardwood Market

—≺ CHICAGO ≻

Chicago continues to move along in a hopeful spirit, this condition of hope being considerably buoyed up by a really gratifying quantity of inquiries which have been developing during the last two or three weeks. It is difficult to tell the exact reason or nature of these inquiries, but it has developed that quite a number of them are based on a desire for stock and from them orders have resulted. In a great many other cases, however, they have proven themselves to be merely feelers, and those receiving them have continued to expect business where it was not forth-coming.

It is gratifying to note, bowever, that the local trade is standing woll up to its task of attempting to hold prices against the sizeable offerings of stock which always come to the Chicago market in times of difficulty. This like other large markets is the recipient of a great deal of stock which must be moved, and of course if there is price-cutting it is to be found here. It is useless to argue that there has been none for there has, but it is also a real fact that during the last couple of weeks lumbermen locally have taken a new heart in the face of the large number of inquiries which have been received and are endeavoring to demonstrate to the consuming trade that lumber is good property.

The final gasps of winter, which keep those depending on weather conditions in an unsettled state, are having their effect. The return of snow and cold weather after a few spring-like days has done much to disrupt local developments in the building line, and as a result a depressing effect has been feit on the part of the interior finish and the sash and door trade, building operations being still held up to a great degree.

It is a fact that sash and door houses are working mainly on stock stuff in soft woods, and as a consequence the demand for the hardwoods which usually starts about the first of June on the part of these people is not being felt.

Low grades continue to be the best sellers locally on account of the continued activity in the box field.

The furniture people are doing good business, but have not opened up In a buying way as they are very hesitant. This policy is influenced to a degree by the policy of the big consumers, who for some reason continue to hold out. However, the vast number of rush orders of small size which are constantly being received demonstrate to the lumbermen that for the most part the scarcity of orders is not due to any great accumulation of stock on consumers' yards.

Local lumbermen anticipate that as a whole the year 1914 is going to be a good one, but seem to feel that the favorable development will be beld off until the last half. It appears that this prognostication in this direction will hold good.

=< NEW YORK >====

The local hardwood market, like many others, is watching and waiting. It is just about out of the most inactive period of recent years and is looking for those changes in physical conditions that are calculated to give trading a boost. The weather since early February has put a stop to all outside work and has also been the cause for much delay in receipts of cars. Most of the business placed during the past several weeks has been for prompt shipment and much complaint has been heard of delayed cars. At the present writing the elements are more favorable and signs of better times are mear at hand. Prices are generally considered fair, though

TROUBLE?

Are you having any lumber trouble?

Does your oak warp, split, check or honeycomb in the kiln?

Does your gum stain, buckle, twist or do the bucking broncho act?

Do you have any difficulty with split panels and defective glue joints?

Do you have to dye, stain or refill your lumber to get a uniform color?

Do you have any reclaims on finished goods from bad glue joints, finish or other reasons?

You can cure all your lumber troubles by using

Kraetzer-cure

TRADE MARK

You don't have to buy Kraetzer-Cured Lumber—you can produce it yourself from air-dried, half-dry or green stock.

Your lumber will then dry in your kilns quick, straight and free of all defects.

We will tell you where to buy Kraetzer-Cured Lumber, if you ask us.

We will tell you about the Kraetzer Preparator, the use of which insures the quick and accurate seasoning of lumber, if you ask us.

We will send you a new and interesting pamphlet involving the entire theory and practice of steaming wood under pressure, if you ask us.

some concessions are noted in ash and chestnut. In each case the decline is about one dollar. Gum is showing some improvement but is not so strong as it should be. The demand for this lumber is steadily improving in this vicinity and it is surely destined to become one of the most popular woods for interfor use.

=< BUFFALO >=

The hardwood trade needs better weather to make things at all active, though trade is reported to be fair for this season. Business has been rather spasmodic for the past month, showing improvement for a brief period under the influence of a little better weather, and then tightening up again. The general feeling is that as soon as the real springlike weather arrives there will be a good amount of lumber in demand, which will strengthen the market to quite an extent. Recently there has been some cutting of prices, particularly in one or two woods.

Maple has been one of the leaders lately, and the price has been holding quite firm. Flooring in this wood has also been in very fair demand, with quotations holding steady. There seems to be plenty of plain oak offering and prices have suffered to some extent accordingly. Birch is in fair demand and some kinds of birch are unusually scarce. Poplar has been showing better inquiry with some dealers. White ash and beech are reported to be showing some increase in sales.

As spring approaches the real estate men are beginning to make plans for a busy season. It looks as if much demand would arise for building lumber within a few weeks. The south section of the city will be built up considerably this spring, owing to the development of new industrial enterprises there and the dredging of Buffalo Creek to avoid all floods, which have been annually a source of loss. About 200 new houses will be built in South Buffalo soon. It is said that a great many new houses will be built in Williamsville, north of the city.

----≺ PHILADELPHIA ≻=

During the first part of March, owing to the accumulated snow and slush, which naturally has interfered with the usual quick transportation, the lumber business suffered a very material check, but if the springlike weather of the last week continues, the streets and roadways will soon be cleared and business generally much facilitated. The trade feels much encouraged over the relaxing hold of winter and an optimistic impression prevails as to an early revival of trading. Reports coming in from eastern Pennsylvania, New York and New England are favorable for a steadily rushed business, and many are confident that more money will have to be paid for lumber in April than at the present time. The sagacious lumberman realizing this is making an effort to protect himself ahead for future delivery.

Quartered oak is unchanged from a fortnight ago; red and white oak in good call with steady prices; ash stronger; poplar and chestnut hold firm. The general volume of higher grades of hardwood is about fair, considering conditions. Low grades have been fairly active right along.

===< BOSTON >=

There is a noticeable improvement in this market in inquiries, orders and shipments, and the improvement is fully as apparent in hardwoods as in the softwoods. A superficial observer might find some dealers who, basing business on what it was a few years ago, would state that business is poor; but as a matter of fact there is a change now to more active business than has prevailed all winter. Inquiry covers quite a wide range of woods, being lightest in poplar and more especially in gum. One prominent feature is the number of orders which are wanted in a rush, which is always a sign of low stocks among the consumers and yards and a comparatively urgent need of lumber for use. In oak, both plain and quartered, in hickory, beech, birch and walnut practically all business is being done on strong market prices. There is apparently a little tendency to weakness on maple and cherry as well as on poplar and gum mentioned above. There seems to be no variation in flooring except possibly on the lower grades of oak floor. The hardwood market of Boston, like most large cities, suffers more or less from substitution for wood in some industries; the latest large element of this kind being the recent decision of the Boston Elevated Railway to floor all cars, both old and new, with a composition in place of the long used hardwood with "lattice" or wooden cordurey in the aisles. This road has had a number of cars being refloored at all times as the wooden flooring wore out, but in the future all cars bought or relaid will be supplied with the new composition which has been tried out in the Cambridge subway cars. This change may be adopted by the great Bay state system, and if so it will mean a very considerable decrease in the use of hardwood for floors in street cars used here.

=≺ BALTIMORE >=

The developments of the last two weeks in the hardwood trade have not been of a character to give much encouragement to either manufacturer or wholesaler. A light demand has prevailed, and even where wants developed it was in many instances well nigh impossible to meet them in consequence of weather conditions. The Northeast was deep in snow a part of the time and hauling became so difficult a matter that it had to be in large part suspended. The yards resorted to an unusual expedient in numerous cases to get lumber with the least delay and trouble. Though

they carried large stocks they put in insistent calls for slapment by rail road, finding it impossible to get the him a from their own assortments and calculating that cars could be shunted to points where the lumber was needed or sufficiently near such points to meet the immediate wants To be sure, the situation has improved since then. Much of the snow that proved such an embarrassment has disappeared, and where there are good roads or other thoroughfares to drive along, the embargo has been to a large extent raised. In the country sections the deep mud that succeeded the snow serves as an obstacle that still troubles the trade. The mills especially experience difficulty in getting lumber to railroads, and other activities that involve bauling are interfered with. This tends to lessen materially the volume of lumber available for distribution and imposes a check upon the movement which has here and there caused a favorable reaction in prices. In the main, however, the returns are not especially attractive at this time, and it is altogether likely that the general business situation will have to take on a decidedly brisker tone before the quotations on lumber work back to where they stood last year. The reduction in some items is not large, being covered by \$1 per 1,000 feet, as in the case of certain kinds of poplar. Sound wormy chestnut is also quite steady at prices nearly the same as those that prevailed during the greater part of As for No. 1 common chestnut, that is a different matter, this grade having eased off very considerably and being in very much restricted call. Oak is likewise easier, though the returns realized are in the main sufficiently attractive to bring out stocks. It has been the indifferent demand rather than the large offerings that has affected values disadvantageously. It does not appear that the mills generally have extensive assortments on hand, and any decided increase in the distribution would soon bring about something like a scarcity. The buyers have not needed stocks and they have shown a marked indifference about entering into new commitments. To the rather sluggish home demand has been added quiet in the export trade. Consignment shipments have so congested a majority of the foreign markets that the buyers there hold out for low prices which the shippers cannot entertain, and the situation abroad remains in bad shape, with poplar very dull and with the necessity for curtailing the forwardings so obvious that the foreign movement is much smaller than last year at this time

──≺ COLUMBUS ≻

Improvement all along the line is reported in the hardwood trade in Columbus and central Obio. There is better buying both from retailers and factories and the tone of the market is better than for some time. The price list generally is well maintained and there are few cases of cutting to force trade. The prospects for the future are believed to be good and a lively trade is anticipated for the coming few months.

Vardmen are gradually accumulating stocks to be prepared for the spring rush. As the winter breaks many building operations will be started and this will mean activity among the dealers. Plans and specifications have been prepared for a large number of new structures, including business blocks, office buildings and apartments. Iwellings are also prominent in the list of new buildings projected. Yard stocks are not large and dealers are loath to accumulate them just at this time. Purchasing agents for factories are also in the market for larger orders. This is especially true of furniture, vehicle and implement concerns. The feeling in manufacturing circles shows a marked improvement and this is reflected in better orders for materials. Automobile factories are buying wide sizes at this time.

Dry stocks in the hands of mill owners are not large and this is taken as an indication of better quotations. In fact, every change made recently has been toward higher levels. Shipments are coming out better now since the railrend congestion is passing away. Collections are also improving in most sections of the country.

Both quartered and plain oak are strong and the movement is good. Prices are firm and inclined to advance. There is also a good demand for chestnut, especially sound wormy. Prices on the lower grades have shown strength recently. Poplar is another wood that is moving better and stocks are not as large as formerly. Basswood and ash are strong and other hardwoods are unchanged.

----**<** CINCINNATI >--

Better weather has enabled yard men to handle stock to a much better advantage and there is much shipping as a consequence. Dealers admit that business is not just right by any means, but there is a very healthy tone to the market conditions and they are not a bit alarmed over the backwardness up to this time, believing that when the consuming plants begin to run, which is fully expected before long, there will be plenty of business, as all plants are carrying very small stocks and will have to buy if they do any business at all. Plain oak is, as usual, the steadlest seller, and all grades are moving well. Quartered oak is doing very well but could improve. The good grades of red gum are still very slow, but dealers expect a better movement in this wood before the midsummer period is reached. Sap gum sells fairly well and shows some sign of Improvement. There is some improvement noted in the movement of the better grades of poplar and the price remains firm. The usual move ment in low grades, which has been heavy, continues, and prices on this grade are stiffening. Manufacturers claim there is a much better future for poplar this year than there appears to be and they are well satisfied with the progress that the wood is making. The movement in all grades

Mahogany and Circassian Lumber & Veneers

¶ The largest assortment of finest figured Mahogany Logs, Lumber and Veneers in the country can be found at the Chicago plant of C. L. Willey.

¶ We are just in receipt of fifteen cars of remarkably superior Circassian Walnut Logs, large size, well-figured and of good color, which are now being cut into Veneers.

¶ A visit or correspondence from discriminating buyers of all varieties of fine Imported and Domestic Cabinet Woods in Lumber and Veneer is solicited.

¶ You will not only find the Willey warehouses well stocked with a superb collection of Circassian, Mahogany, Vermilion, Black Walnut and other fancy foreign and domestic lumber and veneers, but buyers are assured of prompt and painstaking service, and a quality of product not usually obtainable.

¶ To visit the plant take Blue Island Ave. car at the postoffice to Robey Street.

of hardwoods suitable for the box manufacturers is in active demand and dealers have no complaint to make over the movement of this class of lumber. Prices on all hardwoods remain firm.

— ≺ INDIANAPOLIS > —

The hardwood market has been sonewhat brighter during the last two weeks than it has been previously this year. There has been an increased number of inquiries and some buying, although no exceptionally large business has been reported. It seems to be the opinion of most hardwood lumbernien that a business closely approaching normal may be expected this spring. Within the last few weeks industrial and financial conditions in all parts of the state have shown material improvement. Hardwood prices seem to a standar than they were and no change is expected for some little time to come.

——**≺** MEMPHIS **≻**—

The hardwood market here continues fairly active, but there is some disappointment felt over the failure of a larger business to develop. It had been confidently predicted that, with the approach of spring, there would be a decided increase in the number of inquiries and also in the volume of business, but there has been nothing so far to indicate that either has been experienced. It is probable that there is an average volume of business under way but there is no rush in any direction and some outlets are slow about opening up. The recent severe weather in the northern and eastern parts of the country has, without doubt. been a retarding influence so far as domestic business is concerned, while export conditions have shown practically no improvement. Orders are principally for comparatively smaller quantities of lumber, apparently for filling-in purposes. There is a good demand for the lower grades of cottonwood and gum and plain oak has recently come in for a little larger inquiry. Oak as a general proposition is in fairly good call and prices are well maintained. Red gum is said to be a little more active. but there is no decided improvement so far in evidence. Sap gum, as has been the case for some time, is a ready seller. Ash moves without difficulty and bickory and other miscellaneous items, which are handled in a small way, are in request. Cottonwood in the higher grades is not active and there is still considerable complaint regarding the slowness of cypress, especially in grades above shops. Manufacturing operations, while somewhat reduced in some parts of the Memphis territory for one reason or another, are still pretty full here, where millmen are preparing for the better demand, which is expected later.

----≺ NASHVILLE >=

Continued quiet conditions in the Nashville hardwood market are attributed in a large measure to the severe weather that has prevailed during the month. A large proportion of the local output is shipped to the North and East, and conditions for operations have not been favorable in those sections. Business is about the same as last month, with numerous orders, but most of them small. Both quartered and plain oak are good sellers. Poplar has been moving well, considering the total volume, and sales are being made of chestnut, ash, bickory and other lines. The most active demand has been coming from the furniture factories. Prices show no material change.

==≺ LOUISVILLE >=

The hardwood lumber market is showing signs of improvement and, though business has been retarded during the current month by unusually severe weather in all parts of the country, which has hindered the development of business and has affected the hardwood trade adversely. especially by reason of the enforced inactivity in the building trades, the volume of lumber moved has been pretty close to normal. The fact that consumers are down to bed-rock in the matter of stocks is shown by the fact that a good many orders are being placed by telegraph, buyers deciding that they want what they want when they want it. Consequently, it is believed that as soon as the spring trade begins to open up and a normal restocking movement makes its appearance, hardwood concerns will have all that they can do to take care of the business. Prices are steady in most lines, some items, like chestnut, having been the medium of an upward movement on account of the scarcity of stock. Good plain oak is still quiet, but is showing signs of renewed activity. Low-grade oak is moving nicely. Quartered oak is selling well, and prices are firm. Ash is in good call, large handlers reporting a satisfactory demand, and cottonwood is moving.

───≺ MILWAUKEE >=

Logging operations all over the Wisconsin lumber country are being brought to a close rapidly, as a result of the milder weather which is in evidence. Loggers and lumbermen worked their forces to the utmost during the past two or three weeks in the effort to get the logs which were cut to the landings. A vast amount of timber was moved and it is believed that in most cases the largest proportion of the cut is now lying at the sidings or on its way to the mills. Many of the camps are now breaking up for the season. While the Wisconsin log cut was not so large as had been anticipated last fail, it is much larger than was expected later, considering the fact that real winter weather did not put in an appearance until the last week in January.

The favorable weather has had one good effect at least, in that it has

added more life to building operations not only in Milwaukee, but in various parts of the state. A decided gain for the past week and the month to date is shown by the figures at the office of the building inspector. During the past week permits were issued for building to cost \$133,806, as compared with \$87,325 the corresponding week a year ago. There have beca 110 permits granted this month up to date for structures to cost \$215,109, as against 80 permits, representing an investment of \$134,985 during the same period in 1913.

The lumber business is beginning to show a little more life. Dealers are meeting with a better trade and most of them are beginning to find that their stocks are rather low and hardly at a point to cope with the spring rush. Dealers all over Wisconsin have been making inquiries and are now beginning to place some real orders for hardwood. The high prices which are prevailing at the present time are deterring some dealers from buying, but most retailers realize that there is little possibility of prices going lower, in view of the decreasing stocks and the increasing demand

Factory consumers are not coming forward so freely as wholesalers might wish. While stocks on hand at most of the plants are far from being large, there is an inclination on the part of manufacturers to buy only enough to supply their immediate wants. The farm implement and vehicle concerns are buying more readily than other factories, as the business outlook in their particular field is bright. Furniture manufacturers in Milwaukee and about the state are expected to place larger orders from now on, while better inquiries and a fair business are coming in from the automobile manufacturing concerns.

Prices in northern hardwoods are holding especially firm, with demand good for birch, maple and basswood. Low grade basswood is picking up, a natural result of increased activity among the box manufacturing concerns. Offerings of oak from the south are fairly plentiful, but prices seem to be holding their own and the market in this line is as firm as

----≺ ST. LOUIS >--

There is a little more activity manifest in the hardwood situation and there is a seasonable volume of business being done. The number of orders is increasing and inquiries are coming in more freely than for some time. The weather is still anything but favorable for business and this is handicapping trade to some extent. The line yards and factories are coming in for orders for their early spring requirements but they are not buying as liberally as they would be doing with pleasant weather prevailing. Plain sawed white oak seems to be most in demand and quartered red and white oak are not very far behind. Red gum and bone dry ash are in fair inquiry. The prospects for all items on the hardwood list indicate an early advance in prices. Cypress conditions show renewed life. Nearly all kinds of cypress stock are being called for and the number of orders are constantly increasing. Prices are also gaining strength especially on the upper grade material

=∹*LIVERPOOL*≻=

There seemed to be a better tone to the market during the past fortnight and some good sales from stock were made. It is to be hoped, however, that this will not be taken by shippers as a pretext for further consignment shipments. The market has a long way to go before it really recovers its normal condition and profitable trade is once again moving. The timber quays are exceptionally busy, mahogany, hickory and oak planks being the chief features. Lumbermen state that they never before saw so much mahogany and hickory land on the Liverpool quays. Quite naturally, very low figures are ruling for both items. In the hickory market prices as low as eighteen pence per cubic foot Liverpool string measure are ruling, though this price covers wood mainly of inferior quality. Even strictly prime parcels are going at 2s/4d and it is not necessary to say that these prices are not profitable to shippers. The round hickory market is exceedingly limited and very sensitive in the face of heavy arrivals. Buyers here must have the stock, and if only a reasonable control of shipments were made, shippers could easily receive much higher prices. Mahogany was decidedly weak at the last sales and several bargains were moving. While mahogany is still very heavily stocked, there are no signs that prices will go much lower. An improvement upward is anticipated within the next month or so. In view of the heavy stock it is unlikely that heavy shipments will now be made, and though no immediate advance is likely it is thought that the bottom figure has been reached. The bulk of the stock is held in firm hands and there was no tendency at the last sales to throw stock away. On the contrary, brokers were inclined to hold for future sales and some few logs were withdrawn in this way. Oak planks were also again heavily imported during the past fortnight, but have sold surprisingly well in view of the heavy stocks. Birch is very scarce and there is hardly a log in the market of prime grade to offer. Quartered oak in prime grades is in good request and holders of $1\frac{1}{4}$ ", $1\frac{1}{2}$ " and %" stocks of white oak are nearly cleaned out. Tupelo buyers are not very busy at the moment and prices have sagged. The market will come again, however, if shippers will be patient, and for wide stocks an increasing trade is looked for. Cottonwood is weak, as are also the common grades of poplar. Ash lumber is very much overstocked and on no account should consignment parcels be shipped. Ash logs have been fairly good, but consignments are now foolishly pouring in and the future market is not considered very firm.

VENEERS AND PANELS

Ahnapee Veneer & Seating Co.

HOME OFFICE, FACTORY AND VENEER MILL, ALGOMA, WIS. VENEER AND SAWMILL, BIRCHWOOD, WIS.

We manufacture at our Birchwood plant single ply veneers of all native northern woods and deliver stock that is in shape to glue.

From our Algoma factory, where we have specialized for twenty years, we produce panels of all sizes, flat or bent to shape, in all woods, notably in Mahogany and Quarter-Sawed Oak.

We make no two-ply stock, and do not employ sliced cut quartered oak. Our quartered oak panels are all from sawed veneer.

Every pound of glue we use is guaranteed hide stock. We do not use retainers. Our gluing forms are put under powerful screws and left until the glue has thoroughly set.

If you seek a guaranteed product that is the best, based on results accomplished by most painstaking attention and study of every detail, combined with the use of the best stock and an up-to-date equipment, our product will appeal to you.

If you are a "price buyer" we probably cannot interest you.

Custom Mill Work, Storage, Inspection

Foreign Fancy Woods, Mahogany, Cedar, Circassian

We receive the logs, store or warehouse them, manufacture them into lumber, cut or saw veneers, pile and store the product, and ship via any railroad. Also furnish inspection returns on logs or lumber. Can furnish accommodations and economies which it is impossible to secure elsewhere. We always have on our yards parcels of plain and figured African, Mexican and Cuban Mahogany, Circassian Walnut and Cedar logs, placed here for sale by direct foreign shippers, from which advantageous purchases can be made.

Astoria Veneer Mills & Dock Co.

Long Island City, New York

${f V}$ eneers and ${f P}$ anels with a ${f R}$ eputation

WE manufacture Veneers in all the native woods and for all purposes. Also Built-up Panels in native and foreign woods—three and five-ply—and have established a reputation for furnishing high-grade material. Send us your inquiries and orders and become one of our satisfied customers.

SAVE YOUR MONEY BY USING THE

RED BOOK Published Semi-annually in February and August

It contains a carefully prepared list of the buyers of lumber in car lots, both among the dealers and manufacturers.

The book indicates their financial standing and manner of meeting obligations. Covers the United States, Alberta, Manitoba and Saskatchewan. The trade recognizes this book as the authority on the line it covers.

A well organized Collection Department is also operated and the same is open to you. Write for terms.

What Veneer and Panel Consumers Will Use in 1914

This information is shown completely in our new correction pamphlet (off the press this week), which revises our veneer and panel consumers' requirements lists complete according to 1914 requirements. The information contained is all first hand and guaranteed to be authentic. It gives all details that you want to know on which to base an intelligent quotation.

It would cost you thousands of dollars and years of work to compile the same information—we know because that is what it cost us. You can have it for 1% of its real cost.

As its best use is while it is fresh and it costs only two cents to write, drop us a line today and let us

give you the details.

Four Mills

Newest Hoosier Band Saw Mill

We have been building band mills for thirtyfive years and this New Hoosier Band Saw Mill represents the experience of these years.

The simplest mill in construction and the easiest kept in order.

We build this mill in three sizes, 6, 7 and 8 ft. The widest saw the 6 ft. mill will carry is 10"; the 7 and 8 ft. mills will carry 10, 11 or 12" saws. This mill is built in a substantial manner and embodies all that is latest and best in Band Mill design. The base is of the heavy extension pattern and is so constructed

that it does not overhang the foundation but extends completely around the mill. By means of the construction of the column the upper wheel runs in the center of the mill and is supported both above and below the mandrel. The bearings are long and are chain oiling.

The tension device has roller bearings and is very sensitive and durable. The upper guide is raised and lowered by power and is nonbreakable. The lower guide is so arranged that it can be opened quickly. The roll back of the saw is power driven.

The 6 ft. mill will split a 48" log and lay down a 30" board between saw and column; the 7 ft. will split a 54" log and lay down a 36" board, the 8 ft. will split a 57" log and lay down a 42" board.

The Sinker-Davis Co., Indianapolis, Ind.

Makers of Hoosier Saw Mill Machinery

LOUISVILLE THE HARDWOOD GATEWAY OF THE SOUTH

For You, Mr. Small Buyer

We are directing this advertisement particularly to factory operators who believe that their lumber consumption is not large enough to deserve much attention from the leading houses. We want you to know that the business of the small consumer is just as much appreciated as that of the biggest concerns in the country; and what is equally important, we are in just as good a position to take care of it.

You are familiar with the fact, doubtless, that Louisville is so situated that the best assortment of hardwoods in the country is found here. Not merely oak, or ash, or poplar, or chestnut, or elm, or walnut, or veneers and panels, but all of these together, in dimensions and grades suited to your needs. Then, again, our co-operative system, whereby one house supplies deficiencies in the offerings of another, makes the entire lumber stocks of Louisville available for your purposes.

Mixed cars are our specialty. If you need just a few thousand feet of one item or another, don't be afraid to ask for it. We have made a special study of the factory man's requirements along this line, and make no additional charge because the purchase of each item is small. We are here to serve you in this and other respects, and can take care of you as well as we do your bigger competitor.

BLACK WALNUT,

The Aristocrat of American Hardwoods

Manufacturers of furniture, pianos and interior finish know that Black Walnut is the finest hardwood produced on this continent. They may have been under the impression heretofore that it is not possible to get a sufficient continuous supply of this wood to enable them to use it. The purpose of this and succeeding advertisements is to show that there is an ample and permanent supply, and that those who specify it will be able to get it now and hereafter.

The stock listed below is dry and ready to ship, and the firms indicated will be glad to quote anyone interested in logs, lumber or veneers, and also to give full information about the stock.

Review and Outlook

HARDWOOD RECORD staff takes this occasion to voice its deep appreciation of the many kind expressions which have come to us since the death of our late editor, Henry H. Gibson. It has been a substantial consolation for the loss which has been sus tained in feeling that Mr. Gibson had so many and such loyal friends

The institution which he founded, HARDWOOD RECORD, will continue to fulfill its mission as an organ representing the hardwood interests of the country, and will continue as a medium between the manufacturer and consumer of products of the

HARDWOOD RECORD hopes that its friends in the allied hard wood and veneer trades will continue to have the same kindly feelings that they have expressed in the past, and will use what HARDWOOD RECORD can offer on any and every occasion that might present itself.

General Market Conditions

THE TWO MOST FAVORABLE DEVELOPMENTS in the gen eral field during the last couple of weeks have been an increased development of demand from foreign markets, which is probably a result of a gradual tendency toward more favorable freight rates and material strengthening in the quartered oak markets. It cannot be said that these developments have resulted, or will result, in generally strengthening the hardwood situation, which at present is still in rather an unsatisfactory condition generally speaking, but these two features are of real importance, indicating a tendency to broadening out a demand and a consequent stiffening of prices. The situation abroad, as reported by several large exporters, is not in first class shape by any means, but there is a decided indication that there will be a trend toward normal conditions which will eventually lead up to resumption of old time form in export trade.

The situation throughout the eastern states continues to be rather dull, although there has been some "chirping up" both in volume of inquiries and in total sales. Sales continue, of course, to be of a rather unsatisfactory size, but as a general proposition prices are being held in excellent form. There is no reason to anticipate anything further in the way of slumps in values.

Regarding the railroad business: This proposition, according to available reports, seems to be based entirely upon the possibility of securing the 5 per cent increase in general freight rates. As a matter of fact, railroads are simply trading around among the different shops of the various lines throughout the country, accord ing to the immediate requirements of each shop, and are practically out of the lumber market in their lines of purchases until such time as they know which way the question of increased revennes will be decided.

Several prominent railroad officials have but themselves semiofficially on record as stating that the granting of the 5 per cent increase would mean an immediate return to the purchasing field.

Favorable logging conditions in some sections of the southeastern hardwood territory are being seriously threatened by excessive rains, which have washed out railroads and held up the shipments of logs and lumber. This condition has not yet approached anything generally serious, but for some concerns located in that territory it has assumed serious proportions, as they are not sure on taking orders of their ability to make deliveries.

The general opening up of building weather will unquestionably stimulate demand from retail yards and, in fact, this stimulus has already been pretty widely noted and is the strongest point in consuming trade today. Orders are fairly plentiful and of good size and at prices which are, while not entirely satisfactory, at least at a reasonable level. The situation as it can be viewed, considering late developments in general business conditions, offers real encouragement which is based on a stimulus in inquiries above noted, the tendency to hold prices firm, more favorable situation in foreign conditions, applied to hardwood lumber in particular, and a general note of optimism which continues to be evident everywhere. It is, of course, true that big business is still holding the clamps tight, but it cannot be said that this policy is a result of anything more than a conservative regard for the tremendous investments which are involved. The general outlook bespeaks a necessity for steady continuance in a conservative way, but nevertheless presages a steady development in demand and a steadily augmented strengthening in prices.

The Cover Picture

HARDWOOD FOREST SCENE near Jacksonville, Fla., is A shown in the illustration on the front cover of this issue of HARDWOOD RECORD. The picture was furnished by the J. C. Turner Lumber Company, of New York, which owns the land. In the language in use in that state the type here shown is called hummock or hammock land. It is distinguished from the flat swamps, where palms grow, and likewise from the sandy tracts covered with pines. The hummocks are low ridges or slight elevations, and they are usually underlaid by reefs or ledges of corral or limestone. Generally that class of land is very stony. Its soil is thin, except in depressions among rocks, where decaying leaves and other vegetation have accumulated during long periods and changed into black humus.

The three types of Florida forests are quite distinct. The palms

provides a collappea rice, the presstein thin stands with the condition of every except grass and saw painetto; while the hardwork for its arctick, son exhat fangled with limby and learning trees, and said vite load catopy is very dense. Many of the hardwords of corting on such tonests are excepted or so meanly evergenen that the branches are practically always covered with leaves. Often the foliage bangs full twelve months, and the old fulls as the new appears. Some of the oaks which shid then heaves in antimos factors morth, here retain them the whole year.

The Fior an hardwood forests are not generally so variation as the extraction states or other southern states. The free are of inferior size and usually of poor form. Many exceptions to that rule should be noted, particularly in that portion of Florida adjacent to Georgin, where deep red soil prevails. Further south among the hummocks the type of forest is fairly well represented in the coverillustration. Some trunks are shapely, but the majority lack the symmetry and also the size which prevail among the hardwoods of the Mississippi valley, the Appalachian region and the Lake States.

However, Florida is richer in hardwood species than any other state. Nearly two hundred kinds of trees, large and small, grow there. Most of them never find their way to sawnills, because of small size, poor form, and searcity. Species from the tropies have numerous representatives in the southern part of Florida. Some of the islands nearly touch the torrid zone. A little mahogany still grows there, though the commercial stand was depleted sixty or seventy years ago. The oak, which is most in evidence and which is shown in the accompanying illustration, is the common live oak of the southern states. It sometimes attains large trunk diameter, but usually only when it grows in open ground. Some of the wood is of excellent quality, but the tree has never appealed to lumbermen. Its trunk is too short, or if long it is apt to be crooked. Besides, the Florida live oaks are victims of numerous tree diseases which render the trunks unfit for use.

The hummock land, if not too rocky, is fine for orchards and truck gardens, and much of it is being cleared for that purpose. A well wooded hummock is a place of great beauty and interest and some have been converted into pleasure resorts. Such, in fact, is the present use of that shown in the cover picture.

Importance of the Exposition

AS 18 APTLY PUT IN AN ANNOUNCEMENT gotten out by the Hardwood Manufacturers' Association of the United States, "the importance of the Forest Products Exposition to be held at the Coliseum, Chicago, April 30 to May 9, and at the Grand Central Palace, New York City, May 21 to 30, presents the great shop window of the industry to every lumber dealer, manufacturer, distributor and specialist, for trade, educational and attractive reasons."

An attempt has been made elsewhere in this issue of HARDWOOD RECORD to analyze the subject as it pertains directly to the lumbermen's most vital interests, and as it should be viewed by most of the lumber and kindred trades.

There is a real gratifying enthusiasm exhibited both in the taking of space and in plans for the exhibits to be shown. It is unquestionably a fact, judging from present indications and suggestions as to developments as offered by the manager of the show, that it is going to be one of the most educational and one of the most eminently successful and enthusiastically attended expositions ever attempted. It is needless to urge its importance to the lumber industry in all of its phases, but Hardwood Record takes this opportunity of urging every member of the trade to do his utmost to stimulate attendance from out-to-town interests at either the Chicago or New York shows. It will be well worth the time and attention of any home-builder of the country regardless of the character of the structure which he is contemplating or owns, or whether he is merely a cliff-dweller in the modern city flat.

In short, the exposition will offer many wholesome out-of-door features which will appeal to everybody. It will be so radically different from the cut-and-dried expositions which have been featured by advocates of substitutes for so long that it will be like a breeze from the pine woods. Lumbermen must not forget to do their part!

Conditional Endorsement of Freight Rate Advance

The Hardwood Manufacturers association of the United States has put itself on record as being open-minded in the question of the proposed 5 per cent horizontal advance of the ight rates in the official classification territory. Seemingly from the announcement, which has just been given out by this association through Secretary W. H. Weller, it suggests that possible good effects will secrete, op on granting to the railroads this requested increase in revenues, through increased purchases which will undoubtedly result.

Following is a copy of a telegram recently sent to the Interstate Commerce Commission by the association:

"At its meeting here (Cincinnati) today (March 4), it is the manimous consersus of the executive board of the Hardwood Manufacturers' Association that freight rates on lumber are proportionately higher than or any other commodity. We realize, nowever, that it is necessary for the railroads to have a reasonable advance in their rates at this time, and therefore favor the same providing that a readjustment will be made later, placing lumber on a fair basis as compared with other commodities."

The Hardwood Manufacturers' Association advances the logic of simply advancing general rates on all commodities in order to tide over the present decided stringency which seems to have been shown in railroad revenues, and the feasibility of adjusting the general advance is unade rather than holding up such advance werely in anticipation of the possibility of making such adjustment beforehand.

It is significant that various other lumber associations throughout the country have taken the same attitude on this question.

Important But Not Final

THE IMPORTANCE PLACED UPON A RECENT DECISION of the Supreme Court of the state of Mississippi in a controversy which has been going on in that court for the past four years, between the Edward Hines Lumber Company and the state, has not been unduly expressed in reports on that decision.

Briefly, this controversy had to do with the state law specifically forbidding corporations operating within the state to acquire and own more than a specified amount of property. It seems that the Edward Hines Lumber Company acquired considerably more than was lawful under the state law, and the commonwealth brought proceedings to confiscate the property of this company in excess of the amount lawful under the state law. The company, of course, fought the case to the utmost as property valued at millions of dollars was at stake.

The decision handed down specifies that according to the provisions of the law, the penalty to be imposed for violation of it is the forfeiture of the company's charter in the state and the confiscation of the excess property. The opinion contends, however, that inasmuch as these two penalties are specified as being applicable together, it is not legal to apply one without the other. Hence, as the company does not operate under a Mississippi charter, it would be impossible to nullify a charter granted by another state. Therefore the Edward Hines Lumber Company has won at least the first battle in this controversy.

It appears, however, that the question will be somewhat strung out on account of the suggestion offered by the court to the effect that steps should be taken to amend the law making it possible to confiscate excess property independently of the condition of the charter.

Casualty Insurance for Lumbermen

A NEW INSURANCE COMPANY is preparing to begin business in this country. It will write casualty risks for lumbermen, as is implied by its name—Lumber Mutual Casualty Insurance Company. The preliminary steps in organization were taken in New York City in March, and temporary officers were chosen, while the by-laws and other features of the plan were prepared for submission to the New York Insurance Department for approval.

· borner of the property of

the of the start the start engaged in the lumber business in the United States, in in II, forest, and yard. I has it was her a see, what the he count inv will be ready for business. The lists of others and directors, which may be found a nother of a large see, contain the nones of well-known to mess nem.

Getting Ready for the National Convention

B UFFALO SEEMS TO HAVE BEEN unusually blessed this year in the matter of important lumber conventions, it having entertained the National wholesalers early in March, and now being slated to receive the National Hardwood Lumber Association, which numbers something like 900 members. This convention will take place at the Hotel Statler, June 18 and 19. The Buffalo lumbermen have shown their metal by the entertaniment offered at the wholesaiers' convention, and it is expected that they will surpass all previous efforts in connection with the National hardwood meeting as plans are already being perfected to take care of the vast number of attendants.

President Arthur W. Kreinheder of the Buffalo Lumber Exchange called a special meeting of all committees that have been appointed. for the purpose of completing arrangements, and each committee has been given a definite idea of what it is expected to accomplish in order that plans may be perfected as rapidly and as completely as nossible

It is, of course, customary to say in anticipation of any convention that it promises to be one of the best ever held, but it can be truthfully said in connection with this gathering of National hardwood men, that there is no room for doubt, considering the vast membership, the advantages offered by Buffalo, plans for entertainment and other features, that no other convention ever held by the National Hardwood Lumber Association will have been more satisfactory than the gathering at Buffalo in June.

The Flood Situation

PRESENT INDICATIONS are that the lower Mississippi valley will escape serious flood visitation this spring. The season is far advanced and no large volume of water is yet under way from the head streams to the lower reaches of the Father of Waters. There may be heavy rains over extensive areas which will change the situation yet, but such are not anticipated. Unusual storms would be necessary to produce destructive Mississippi floods under present and prospective circumstances. Little snow lies in the upper Mississippi valley; the same situation obtains on the headwaters of the Ohio. The snows on the upper tributaries of the Missouri are a long way off, and they are not particularly heavy. If a late spring flood goes down the Mississippi this year it will be produced chiefly by rain, with little assistance from nelting snow. Such is not looked for.

Nevertheless, the flood peril remains in the lower Mississippi valley as a perpetual menace. One year may miss, bu: another will hit. Unfortunately, when immediate danger is not apparent, the people are prone to forget the necessity of preparing for trouble; but when the danger comes, it is too late for adequate preparation,

Bills are before Congress which provide extensive, and what is believed to be adequate flood protection for the low country along the Mississippi. The bills have not yet become laws, and after they are made effective, if they ever are, years will be necessary for the carrying out of the plans. Meantime, floods will periodically go down the rivers and cause destruction of property on thousands of miles of inundated land.

Standardizing Veneers and Panels

I agricus in the first state of the first state of the figure and the first state of the tardarts in the development in the use of veneers and panels in cabanet, interior and similar work, has ocen the lack of standard-zed sizes and thicknesses for various purposes. The growth of the use of this class of material in the face of the difficulties which have confronted it has been nothing short of astonishing. Nevertheless there has been of late a decided tendency on the part of manufacturers to endeavor at least to standardize specifications as to sizes, thicknesses, etc., for different classes of work, and this idea as it develops will prove of exceeding importance in furthering the use of vencers and namels

There is really no excuse for lack of standard sizes in practically all lines and uses, as such standar i specifications would be comparatively easy to formulate with a little application of the right kind, The lack of standard sizes makes vencer and panel work more expensive in every way as it obviates the possibility of continuous operations on stock goods during times of slack orders for special work, and it is entirely practical that if the manufacturer could go ahead accumulating stock of standard dimensions and specifications when things are a little slow in the other lines, he would be able to materially reduce his average cost of production,

It is to be hoped that work in this direction will progress as favorably as it has of late, and that eventually the proposition will so far as is possible be standardized in every way.

Steel Ties and the Sunday Supplement

TdAT RANKING AUTHORITY (2), the Sunday supplement of a well-known metropolitan daily, avers that steel ties will eventually prove the salvation of the railroads and of all those who travel on them either by force of necessity or for pleasure. It avers that the wooden tie has proven a veritable terror as a cause of wrecks, resulting in an endless succession of accidents due to spreading rails, and that the more stable security offered by the employment of such a solid material as steel will not only offer additional comfort, but will offer absolute safety and incalculable saving in the cost of

Inasmuch as the main contention was based on the safety factor. it is probably well to take up that point first. A little investigation on the part of the writer of this story, which would be humorous if it were not read by several hundred thousand gullible and uninformed people, would have disclosed the fact that the main cause of rail spreading is not failure of the ties, but failure of the spikes which are made of the same metal as this writer proposes to put into the ties themselves, namely steel. It can probably be safely stated that not one case of rail spreading in a hundred is caused in any way directly by the ties themselves.

As to the factor of comfort: The various unsuccessful experiments which have been made here and abroad have left no room for arguments as to which is the more comfortable tie to ride on-the wood or the steel, with the modern methods of preserving wooden ties the life of such tie material is infinitely greater than the life of steel ties. Subject to the trying conditions of part contact with soil and part contact with air, the question of rusting out would be a matter of but a short time. Such rusting would further be insidious and difficult of ascertaining until such tie had claimed its toll of life and property by failing at the crucial moment.

This is but another of the misguided and unwarranted attacks upon products of the forest, which it is hoped will be somewhat nullified in their effect by the Forest Products Exposition.

Value of the Wood Exposition

The approaching Forest Products Exposition in Chicago and New York has not been called into existence for amusement and entertainment. Its purposes are serious, and unless those purposes shall be carried out, the object will be defeated.

The fight for substitutes is on. Pretty much everything under the sun is being tried as substitutes for wood, and the campaign is vigorous. Lumber is being placed on the defensive by dealers who have other materials to sell and who are trying to secure markets by conveying the impression that there is not enough wood to go around or that other things much better have been found to take its place.

Every exhibitor should resist that campaign. There is enough timber, and for most purposes for which it has been used it is superior to substitutes. These facts should be shown by examples. Wood ought to be given an opportunity to tell its own story at the exposition. If it is given that chance it will make good. It is plentiful and of abundant kinds. Its range of uses is almost as wide as American industries. Notwithstanding this fact, efforts more or less successful are being made to discredit this high-class material and to displace it in order that inferior substitutes may take precedent.

That movement can best be defeated by a fair and honest showing of what wood is good for. The exposition should do this. Whoever places an exhibit there should make it tell the story of wood's usefulness and superiority.

The Northern Hemlock and Hardwood Manufacturers' Association and the Michigan Hardwood Manufacturers' Association have combined their exhibit and will have a bungalow trimmed with basswood stding, northern white cedar shingles, the living room finished in elm, with red birch flooring; the dining room in birch, with red birch floor; the bedroom white maple, with birdseye flooring; bathroom, white birch, with white maple flooring; birch in kitchen, with unselected maple floor, and the porch floor and ceiling of tamarack.

The decorative scheme at each exposition will be appropriate and extensive, including growing boxwood hedges as dividing rails and asiles in the main portion of each exposition, natural and artificial branches and leaves, bark and trees, to carry out the forest atmosphere. The Redwood Mill Owners' Association, with its display of California redwood, will have a bungalow of two rooms, exterior of boards from house and barn built at Fortuna, Cal., in 1853. The interior will be trimmed in the finished product, and an incident will be a redwood table 72 inches long, the length of the table being the width of the plank.

Some of these matters bear only indirectly on the practical, modern uses of lumber, but the decorative features, and even the strange and unique, cannot be wholly ignored in an exposition which is intended to appeal to the general public, and which, in order to be successful, must attract many visitors.

Details of exhibits are slow in forthcoming, due largely to the process of preparation, and the prospective exhibitor is more or less unwilling about claiming things that might not be shown, or outlining original plans and devices that are intended as surprises and naturally withheld until the opening of the exposition. The initial exposition opens at the Coliseum, Chicago, April 30, and continues until May 9, and during this time it is expected a number of important regular or special meetings of various trades organizations will be held. The Northern Hemlock and Hardwood Manufacturers' Association will have its convention on the opening day. The National Lumber Manufacturers' Association will hold its annual convention on May 5 and 6. In this connection the Lumbermen's Association of Chicago has appointed a special committee to arrange details for their participation, in a sense acting as host to the great number of lumbermen and representatives of the affiliated branches of the industry, while the women visitors will probably be entertained by the ladies of Chicago who are related by marriage to the industry. The New York organizations have not perfected their plans, but it is understood they will take the same action and have official representation in the exposition. At Chicago, Tuesday, May 5, has been designated as Chicago Day, when the local trade interests will dominate the program.

It will be a splendid opportunity for manufacturers of woodworking machinery, and the arrangements thus far announced show that many valuable exhibits of that kind will be installed.

More or less elaborate exhibits are being prepared by E. C. Atkins & Co., Henry Disston & Sons, Clyde Iron Works, Rayner & Parker, Philadelphia; Seattle Cedar Lumber Manufacturing Company, American Hoist & Derrick Company, American Forestry Association, American Sawmill Machinery Company, Howard, Simmons & Co.; Barrett Manufacturing Company, Franck-Philipson & Co., Lidgerwood Manufacturing Company, Chicago Machinery Exchange, Baxter D. Whitney & Son, Winchendon, Mass.; Mossman Wood Turning Company, Fitchburg, Mass.; estate of William S. Doig, and a number of others, while the Gum Lumber Manufacturers' Association, American Wood Preservers' Association, National Box Manufacturers' Association, Oak Manufacturers' Association, and several of the leading trade publications and trade associations have secured space for more or less elaborate exhibits. The railroads are preparing to provide special accommodations and run excursions from a number of adjacent cities to each of the expositions, and one of the most daring "house-moving" acts in modern history will be the special transportation of the Forest Products Exposition from Chicago to New York practically intact.

Much stress is being laid on the showing which the Forest Service will make with \$10,000 specially appropriated by Congress. It will be an exhibit of uses rather than of tree growing, though it is presumed that something of both will be shown. The Forest Products laboratory at Madison, Wis., and the office of Industrial Investigations at Washington, D. C., are directly engaged in the utilization of wood, and the exhibits which they will make will doubtless prove of great interest and value.

One of the important features of the exposition will be the moving picture display, reproducing in vivid detail sensational and interesting scenes of logging, milling and other attractive operations in the industry. Some of these scenes will be principal mills of Europe and a number of very effective American films. These things, however, will not be the leading features of the exposition, though valuable along the educational line.

American Hardwoods in Liverpool

The London Timber, speaking of the Liverpool market, says that the spot demand for American hardwoods is fairly satisfactory, but the week's additions to the already abnormally heavy stocks do not help matters, and are having a somewhat depreciating effect on values, making sales on profitable lines more and more difficult, and in the majority of woods such things as contracts are unknown. Meanwhile, the brokers are having a quiet, though not happy, time, waiting, like Mr. Macawber, for something to turn up. Wagon oak plank shippers have surely gone mad, and few of them will be able to look back with any degree of pleasure to their trading experiences of the past six months. In addition to the very heavy stocks held by merchants, there are many thousands of planks stored for shippers' account: on top of all these there arrived last week nearly 20,000 more, and the consumptive demand is down to somewhere near zero; it will, therefore, require a cessation of shipments for about six or eight months to put the Liverpool market into a satisfactory state.

Forestry School in California

The University of California, at Berkeley, is the latest to establish a forestry school. Walter Mulford, who at present is head of the forestry department at Cornell University, will take charge of the California school. The Pacific Coast has of late years been active in work of this kind, and this movement will greatly strengthen its position. Professor Mulford is recognized as one of the most progressive teachers of ferestry in this country.

HENRY H. GIBSON

CHICAGO, ILL.

BORN JANUARY 26, 1855

DIED MARCH 25, 1914

Henry H. Gibson

So Portrait Supplement

It is the said daty of Hamborn Recome to altered the death of its founder and editor, Henry H. Gibson, who died suddenly of heart failure on Wednesday evening, March 25. Mr. Gibson had been in delicate health for the last few years, but his friends had hoped that he was improving and they certainly had no thought of his untimely end at a time when his brilliantly matured intellect and sane judgment made him perhaps the most valuable writer on forest products of the last decade.

Not to our knowledge has any other writer on lumber and forest topies had the peculiarly practical experience in both the newspaper and number trade that was Mr. Gibson's. As a boy he was a newspaper man starting at Flint, Mich., becoming later the editor

of the Grand Rapids Leader.

Soon after his marriage to Idah McGlone at Flint, Mich., he entered the employ of his wife's father, who was a well-known lumberman. Here he learned the lumber business theroughly, not only the selling but the buying end, and some years afterward went into business for himself in Sandusky, later moving to Cincinnati.

Ill health caused Mr. Gibson to give up his Cincinnati business and go into the southern pine woods in search of health, and for some years he conducted a mill in Whitley, Tenn. This, too, he had to give up on account of his health and a severe surgical operation. While recuperating he accepted a position on the American Lumberman, a paper for which he had written since its inception.

In January, 1905, Hardwood Record was launched with Mr. Gibson as president of the company and editor and manager, this company taking over the Chicago Hardwood Record, which had been published as a comparatively local publication up to that date. It is not necessary to say to our clientele and the lumber trade that this venture was a success from the start, and Mr. Gibson's advice on lumber conditions and lumber operations was not only asked through the columns of Hardwood Record but also his personal counsel was sought by the largest concerns and factors in the trade.

Of direct and incisive style, trenchant with fact and often pointed with humor, Henry Gibson's writings have chronicled the history of the hardwood lumber trade for the last nine years. A man of great courage and clear convictions, he never wrote anything that he did not feel in his heart was the truth, and for this singleness of purpose and sincerity of speech his friends—who were all who knew him either in a business or social way—admired him most.

There was no man who loved his friends more and who would do more for them than Henry Gibson. His sympathy was boundless,

his effort untiring in a friend's cause.

Henry Gibson was an eminently successful man in the fact that he accomplished everything he undertook. He never ceased to accumulate money for its own sake, but he was vastly interested in the game of life and played it to the last with a zest that even ill health could not diminish. He loved the woods and often remarked "next to my wife I love a forest tree."

He was the most tolerant of men, always ready to give anyone the benefit of the doubt.

Mr. Gibson was singularly happy in his married life. The wife who shared with him the adversities and good fortunes of a busy and varied life, which embraced residence in a number of the larger cities of the country as well as in the forest and in the mountains, was a true componion to him and he to her. Mr. Gibson never boasted that he was a lover of home, but it was very easily seen that he took no greater joy than extending to his friends the fullest hospitality of his home life.

In his capacity as an employer, Mr. Gibson was singularly fortunate in having the knnck of conveying to those whom he employed the feeling that they were simply part with him in an organization which was working for a specific purpose, and imparted to his co-workers his own enthusiasm and convictions, with the result that the organization which he built up worked with the deepest loyalty, singleness of purpose and thought, without the usual feeling that it was simply a paid factor to carry out his wishes. In his business life he never asked anyone to do what he was not capable of deing and ready to do himself.

Mr. Gibson was in no sense a clabman, although singularly gifted in the attributes which usually go to make up the successful follower of club life. He was an exceedingly elever mixer, approaching new acquaintances easily and agreeably, and invariably making the favorable first-impression which is essential to the ability to mix well with men of affairs. However, he had always considered his home as his club, and at the time of his death his only club affiliation was with the Lumbermen's Club of Chicago.

On October 1, 1912, Mr. Gibson, with Albert Kraetzer, Burdis Anderson and H. C. Holthoff, incorporated The Kraetzer Company, a concern which exploited the commercial possibilities of the process of preparing lumber for drying by steaming under pressure in a steel cylinder. This proposition under Mr. Gibson's most able guidance has enjoyed remarkable success. Mr. Gibson was president of the concern, and had chiefly to do with the sales of the apparatus.

One of the most notable achievements of the deceased was the compilation of a remarkable series of articles describing in minute detail the scientific and economic facts regarding every commercial tree of the United States. This work was started in the form of a series of articles which were begur. by Mr. Gibson shortly after commencing the publication of Hardwood Record. About a year and a half ago, with the assistance of Hu Maxwell, formerly of the United States Forest Service, Mr. Gibson compiled this remarkable series in book form entitled "American Forest Trees," which will stand for all time as a very fitting monument to his memory.

During his work with Hardwood Record, Mr. Gibson was instrumental in inaugurating several associations having to do with the hardwood business and in fostering their development. He rendered his best efforts to this work and it was his personal pride to see the progress which the organizations have since made. His close touch with all phases of the hardwood business, with the manufacturing and merchandising of the products of the hardwood forest, rendered him eminently fitted to carry on organization work of this character.

Henry H. Gibson was born at Camden, N. Y., January 26, 1855. He leaves a widow, an aged mother and a sister, Mrs. F. E. Stevens, of Grand Rapids, Mich.

There was a brief funeral service in Chicago on Friday, March 27, previous to conveying the body for interment to the home of his sister in Grand Rapids, Saturday morning, March 28. Mr. Gibson was buried in the family lot in the Grand Rapids cemetery. Grand Rapids lumbermen acted as pallbearers.

The broad and loyal acquaintances of our late editor is convincingly shown through the number and character of letters and telegrams which were received by his widow and at this office following his death. We believe that it is due his widow that the expressions of some of his friends in the trade are shown herewith. It would be impossible to publish even a small part of the communications received, but a few of those from some of his oldest friends in the trade follow:

Henry II, Gibson, editor and manager of Handwood Ricond, died suddenly of heart failure in Calcago Wednesday evening, March 25, 1914. Mr. Gibson, who was an authority on hardwoods, and who, in Handwood Ricond, presented to the world a remarkable series of articles on American forest trees, was a native of Camden, N. Y., and at the time of his death was fifty time years old. He was a warm personal friend of many members of this class, who received the news of his death with sincere sorrow and regret. In view of Mr. Gibson's eminence in the hardwood field, and the personal loss we have suffered in his death, the following resolutions are extent d.

 $R_{\rm C}=-(c/L)$, the four declination of Chernogard the Herri Hilbert sense is a form both personal and to the finder as the content with the content widow, who survive him to desire the proposed Lie content when Γ is sufficient to cost of his solidation, as

Norcotk, Va., March 31, 1914

At the recent acceting of our association the members learned with great regret of the death of Mr. Gibson, and unanimously adopted reso lutions showing their respect for him and their sympathy for Mrs Gibson. I trust you may receive them in the spirit which prompted their passage, for among the members of our association there may be counted many staunch friends of Mr. Gibson to whom he had endeared himself W. B. ROPER. in many ways.

Secretary Treasurer

In Memoriana

Henry H. Gibson

Whereas, God in His infinite wisdom has deemed it best to call from the sphere of his earthly activities Henry II. Gibson, in the prime of his

WHEREAS. In his busy career as editor, author and publisher he had exhibited a wide knowledge of the lumber industry, coupled with an endeavor to further its best interests and to be of service to the lumber men of the country, and

WHEREAS, In his social intercourse with his fellow men he has endeared himself to all by his genial good fellowship, his self-sacrificing friendship, and persistent optimism, therefore be it

RESOLVED, By the members of the North Carolina Pine Association in annual meeting assembled this twenty-seventh day of March, 1914, that in the death of Henry H. Gibson we have lost a friend whom we shall sorely miss, and the industry an advocate and counsellor that will be

RESOLVED. That we tender to the bereaved family our sincere sympathy, and we trust that the remembrance of his life and service may cheer them

RESOLVED, That a copy of these resolutions be sent to Mrs. Gibson, a copy filed with the minutes of this meeting, and copies given the

The board of managers of the Lumbermen's Club of Chicago met Thursday noon and adopted the following resolutions of respect on the death of Henry H. Gibson:

WHEREAS, The members of the Lumbermen's Club of Chicago have been greatly shocked to learn of the sudden death, March 25, 1914, of Henry H. Gibson, a member of this club; and,

WHEREAS, The loss of Mr. Gibson, both as a fellow-member and a friend, is keenly felt by all of his acquaintances among our membership; and the most profound sympathy is entertained for his family in their great bereavement; now therefore, be it

RESOLVED, That these resolutions of condolence be spread upon the records of this club, and that a copy hereof be transmitted to the members of Mr. Gibson's family.

Buffalo, -N. Y., March 28, 1914.

With deepest sorrow we learn of Mr. Gibson's death. Please accept our heartfelt sympathy. The Buffalo lumbermen have always recognized in Mr. Gibson a true friend and one who devoted much time to the upbuilding of the hardwood industry in this country.

THE BUFFALO LUMBER EXCHANGE, A. W. Kreinheder, President.

Cincinnati, O., March 27, 1914.

The death of Mr. Gibson removed a remarkable figure from the hardwood industry, as well as leaving an aching void in the hearts of a legion of friends. His brilliant mind has left a lasting impression in the fields of his activities, while his charming personality made him always a welcome visitor and a delightful companion. Having been so richly endowed makes the loss keener.

I take this opportunity of conveying to HARDWOOD RECORD, on behalf of the association and its officers, sincere condolence to the memory of him whom we always found a friend. We are also not unmindful of the crushed heart at home, and to her also we give our sympathy.

Very truly yours.

EDWIN E. MYERS.

Assistant Secretary Hardwood Manufacturers' Association of the United States

Cadillac Wich, March 28, 1914

The hardwood interests have lost an able and valuable friend, for we believe there was none who understood these things better than did Mr. Gibson.

We wish you to kindly, in behalf of this association, express our sincere regret at Mr. Gibson's removal from our midst, and to extend to his

Very truly yours.

MICHIGAN HERDWOOD MANUFACTURIES' A SOCATION, J. C. Knoy Scerelary

Nortolk, Va., Marca 26, 1914.

Dear Mrs. G. com

Words can be but finkling cytabals to you now from whom ever they come, but let me say that I too loved the great soul that is at rest and ask you to believe that even tomorrow has a tragrant flower, the blessed privilege of remembrance. In the aftertime when the days are dark and the hours dreary let my friendship and esteem help you in all ways,

BOLLING ARTHUR JOHNSON, Editor Lumber World Review.

Baltimore, Md., April 1, 1914.

Dear Mrs. Gibson:

I write to extend to you my deepest and most sincere sympathy for the loss of your husband, Henry. It is needless to say to you that he was one of my chummiest kind of friends in the lumber fraternity, and was one that was always eulogizing his family, their usefulness and good attention to him.

I feel that I have lost personally one of the best friends I have made since in the lumber business. His social interest always carried with it something of elevating interest as well as the good that had a text for future success

My brothers, too, join me in extending to you our heartfelt sympathy. Very sincerely,

ROBERT E. WOOD R. E. Wood Lumber Company.

Chicago, Ill., March 26, 1914.

My Dear Mrs. Gibson:

How little words express when the heart strings are torn and the mind is dazed, by the taking off of one who was so dear to us as Henry. I cannot realize that I shall never see him again. His coming to me as he did so often to confer and advise, always cheerful and bright, that it was a great pleasure to lay aside my work and listen to his pleasant voice, and absorb the good things he always had to offer. Henry was the only one of my friends whose call has left some food

for thought, on saying good-bye.

May God give you strength to bear this great affliction, is the prayer of your sincere friend,

HARVEY S. HAYDEN.

Saginaw, Mich., April, 1914. In the death of Mr. Gibson the writer feels a personal loss, as he prized his friendship highly. The lumber trade generally will miss Mr. Gibson very much indeed, as he always was working hard for its interests. JOHN D. MERSHON LUMBER Co.,

John D. Mershon.

New York, N. Y., March 27, 1914.

It is with deep regret that we learn of the death of Mr. Gibson and we offer our sincere condolence. The lumber industry has lost a firm supporter and the lumber trade press an honored member.

NEW YORK LUMBER TRADE JOURNAL.

Cincinnati O. March 27, 1914

My Dear Mrs. Gibson:

I am so depressed by the sad nows of Henry's death, I feel that I can scarcely say a word of comfort to you.

All who knew Mr. Gibson will feel that they have personally lost one of the truest and most upselfish of friends. I feel that way. I sorrow with you.

Sincerely yours, OTIS A. FELGER.

Townsend, Tenn., March 27, 1914.

My Dear Mrs. Gibson:

With profound regret and sorrow have just learned of the death of Mr. Gibson. On account of sickness in our family it is impossible for Mrs. Townsend or myself to attend the interment, which we regret exceedingly. Mrs. Townsend joins me in most heartfelt sympathy to you in your bereavement.

W. B. TOWNSEND.

My dear Mrs. Gibson:

I wish to extend my utmost sympathy to you in your bereavement. Mr. Gibson was very dear to us. If I can be of any assistance to you, I am at your service.

Sincerely yours,

C. L. WILLEY.

Objections to Car-Spotting Charges

On February 27, and continuing several days thereafter, the Interstate Commerce Commission in session at Washington, D. C., h and testimony on the complaint of certain interests which obnected to the railroads' practice of charging for spotting cars. A brief was filed by the National Wholesale Lumber Dealers' Assoeration in which the members declared themselves opposed to any regulation that will add a charge to shippers or consignees for placing cars upon spur tracks for loading or unloading, and stated reasons why such services should be continued as at present without

They say it has been the policy for many years for the roads of this country and Canada to encourage the building of spurs, and this has enabled the earriers to develop their traffic enormously with little or no expense to them. The railroad rate has always been recognized as covering not only the conveyance of a shipment but the full service, which includes furnishing a car, a proper place to load it, the conveyance of the shipment and its terminal delivery. Where there are no spur tracks the present rate includes placing the car at the public team track at destination in an accessible position for unloading.

"This," says the brief, "constitutes a service which is not obtained by the industries having spur tracks. The delivery on an industry spur is not supplemental to any other delivery. Freight cars arriving at break-up yards are there segregated and switched to the various tracks to which they are ordered; some are placed on industry spurs while others are placed on public team tracks. In either event there is a switching movement and, if a shipper or receiver pays for a team track delivery and does not receive it, but receives a spur track delivery, which costs the carrier no more and in the majority of cases less, he should not be compelled to pay a charge for a service which has not been rendered, but on the contrary, it may well be argued that he should be required to pay less for accepting delivery at a point which is less expensive to the carrier. These industry spurs form a part of the carriers' terminal facilities and should be so considered."

The brief also discusses the advantages of spur tracks to the carriers. A spur track insures to the carrier both inbound and outbound traffic, a condition which does not obtain in the case of public team tracks. This fact is recognized by the carrier and is generally made a part of any contract or agreement between the carrier and the industry prior to the installation of the spur. These spurs increase the terminal facilities of the carriers with little or no expense to themselves, and so save them insurance, taxes, maintenance, operation, etc., and also reduces their liability.

"In the lumber business," says the brief, "cars are generally loaded or unloaded from the industry tracks within a few hours after placement, the average being less than 24 hours, and it is seldom that cars are detained beyond the free time. This gives the carrier the use of the car full 24 hours in advance of what could possibly be obtained by public team track delivery. It puts the car back into railroad service and saves the carrier at least one day's

The Michigan Hardwood Manufacturers' Association, consisting of about seventy-five firms of sawmill men of Michigan, was represented at the hearing in Washington by its secretary, J. C. Knox, but as he was unable to remain over to the adjourned meeting on Monday, March 2, he was advised by Mr. Brandeis to present the views of his members in writing. Therefore the following statements were filed:

Lumber as handled by all of our members is strictly a carload commodity, fully one-half of it moving in open cars, usually loaded to near the carrying capacity of the equipment used, at high rates as compared with other commodities similarly handled, and furnishes a constant volume of tonnage to the railroads. Each of the industries is located on or adjacent to one or more railroads and the railroad side tracks, usually not of great length, extend into the yards and property of the shipper and in many cases the shipper has given up very valuable property for the use of

struction by furnishing this, grading and other equipment

Many of our members have their logs hauled in train loads from side sawrish, where the timber is manufactured, the log haul ranging from a few miles to 100 to 250 miles, for which a specific rate is charged from point of shipment to destination.

It is customary and has been the practice of the earriers to place these cars on such siding for loading or unloading and this service has always been included as a part of the through rate. Many of our members located in the larges eities have given up valuable property for the use of the railroad tracks. We realize that this is mutually advantageous to both the railroad and the shipper, but if the railroads were compelled to buy property adjacent to the mill of the shipper for said track purposes, it would cost them a large amount. These tracks save warehouse and team expense to the carriers and the switching is done as unickly on the tracks in the yards of the carriers as could possibly be done at the carriers' warehouse or feam tracks and at no greater expense.

We wish to state that it is our view that no charge should be made for what is called the spotting of cars at the tracks of the shipper, as we consider that the railroads when making the rates contemplated their covering this very important part of the work.

This association has gone on record as in favor of a 5 per cent advance in freight charges, providing this 5 per cent is equally distributed and covers its competitors in other territory outside of the Official Classification territory. The shippers in the lower peninsula of Michigan being located at the northwestern edge of the Official Classification territory come in sharp competition with manufacturers in the upper peninsula of Michigan, also in Wisconsin and Illinois located in Western Classification territory, where no advance in rates to the West has been contemplated, although the railroads serving the territory described at the request of the Official Classification railroads, filed their tariffs for a 5 per cent advance covering Central Freight Association and Trunk Line territory.

On account of the railroads cutting off various commodity rates, both state and interstate, and filing no commodity tariffs at a 5 per cent advance, thus throwing the commodity rate on a classification basis, this association has been compelled to enter complaint with the Michigan Railroad Commission at Lansing and the Interstate Commerce Commission at Washington, against advances in excess of 5 per cent, and we have recently been advised by the carriers that it is their intention to correct such discrepancies, making only an advance of approximately 5 per cent.

Many lumbermen feel that the present rates on lumber throughout the country are on too high a basis at present as compared with other low commodity rates, and there should be no advance whatever in lumber rates. Nevertheless, if after the commission's investigations, it is decided that the carriers are entitled to an advance in rates, the members of our association will not oppose such an advance, providing such advance was fully equalized.

The understanding that prevails among shippers and receivers of lumber is that the present rates include something to cover the acceptance and delivery of shipments at terminals, especially in all Official Classification Many important cases decided by the commission, since its creation by the act of 1887, have involved lumber rates and in such proceedings the carriers, in defense of rates attacked, have filled thousands of pages of record with testimony about the terminal expense which they assume in connection with the rates, or in other words, many rates attacked as being excessive, unreasonable or otherwise in violation of the statute, have been explained and defended by the carriers and frequently adjudicated by the commission as being predicated upon, not only the line haul but some extraordinary expense in connection with the acceptance or delivery of the traffic at the terminal.

Unless the commission should make a very thorough and complete investigation of all the circumstances and conditions at each terminal, any charge of terminal service added to the present rate must be entirely arbitrary and it does not seem that any substantial benefit or justice can be accomplished by such method. We fear that the establishment of such an arbitrary charge for terminal service in addition to present or future rates would amount to an admission that present rates included nothing but the line haul.

We appreciate that present transportation conditions imposed upon the country at large are a burden which must be lifted or lightened, but surely that burden need not entirely rest upon shippers or receivers of freight who load or unload on private side tracks. Such shippers, we think, have contributed less to the burden of the carriers than have the shippers who demand and have received the freight house and public team track service in congested terminals where the cost of maintenance and operation must

To endeavor to meet the present necessities of the carriers by an arbitrary addition to present rates of any amount per car for terminal service would seem not only completely to destroy every existing theory and principle of rate making but also to be entirely opposed to the conservative policy which has so successfully guided the commission during its existence. Should the commission, after careful investigation and a complete Sarvey of remnal conditions at all important points, decide that the terminal charge and the line hand charge must be segregated, the experience gained in arriving at that decision by such method would quality the commission to prescribe the method by which such segregation should be accomplished and we are inclined to believe that something of that character must be accomplished sooner or later. Should the commission make to han enfort the numbers of this association would contribute

all within their power to the success thereof, but as we understand the present situation we cannot agree that anything of a tangible or permanent benefit can be accomplished by penalizing side track delivery with an arbitrary charge per car of any amount.

We are, however, unafferably opposed to the spotting charge and it would work great hardship to the lumbrumen of Michigan to be charged for placing and removing cars from what is known as private sidings.

Decision on Canadian Imports

The Board of General Appraisers in New York on March 18 handed down its decision in the protest of the Campbell-McLaurin Lumber Company against the ruling of the Treasury Department that a shipment of novelty siding from Canada was dutiable at 15 per cent ad valorem. The government contention was that novelty siding was further manufactured than sawed, planed, tongued and grooved, and was therefore dutiable. The importers claimed that novelty siding was produced by a single operation similar to the process through which tongued and grooved material was put, excepting that by an adjustment of the machine knives only half the tongue was made on one edge and a concave design was produced on the other edge.

The decision is sweeping in character and will go far to clear up the situation with respect to other imports of lumber. The Treasury Department has also ruled that beaded ceiling is dutiable and bases its rule on the contentions in the case of novelty siding. The importers, W. M. Crombie & Co., of New York, have lodged a protest against this and are confident that it will be allowed. The decision in the novelty siding case follows:

McCLELLAND, G. A.—The issue presented in this case is whether certain lumber known as novelty siding imported from Canada is subject to duty at the rate of 15 per cent ad valorem, under paragraph 176 of the tariff act of 1913 or entitled to free entry under paragraph 647 of said act. These paragraphs are as follows:

House or cabinet furniture wholly or in chief value of wood, wholly or partly finished, and manufactures of wood or bark, or of which wood or bark is the component material of chief value, not specially provided for in the section, 15 per centum ad valorem.

647.

Wood: Logs, timber, round, unnanufactured, hewn or sawed, sided or squared; pulp woods, kindling wood, firewood, hop poles, hoop poles, fence posts, handle bolts, shingle bolts, gun blocks for gunstocks rough hewn or sawed, or planed on one side; hubs for wheels, posts, heading bolts, stave bolts, last blocks, wagon blocks, ear blocks, heading blocks, and all like blocks or sticks, rough hewn, sawed or bored, sawed boards, planks, deals, and other lumber, not further manufactured than sawed, planed, and tongued and grooved; clapboards, laths, pickets, palings, staves, shingles, ship timber, ship planking, broom handles, sawdust, and wood flour; all the foregoing not specially provided for in this section.

It is difficult to conjecture upon what theory the collector classified this lumber under paragraph 176, unless it be that it comes under the provisions for "manufacture of wood."

The evidence is that this lumber, ranging from 10 to 16 feet in length, six inches in width and one inch in thickness, is reduced to its present form by being put through a Berlin planer. The process is thus described:

"The board is fed through the planer by pressure rolls crowding it

against the knives."

The smoothing of the sides and edges, as well as the coving or concaving effect, are all produced by planing, the knives being adjusted so as to produce the desired results. These boards are known generally as "novelty siding" and sometimes as "clapboards" or "fancy clapboards."

The witnesses, who appear to be men of extended experience in the milling and lumber trade, practically unite in saying that planed lumber, as known to the trade, embraces all forms of lumber that are made through the use of a planer, or planer and matcher. Very clearly it would seem as though paragraph 176, supra, was not framed to include such lumber for the very obvious reason that it has not lost its identity as lumber by being manufactured into an article with a distinct and new name. The most that may be said here is that these boards are lumber manufactured, which is altogether different from being manufactures of lumber. In United States vs. Dudley (174 U. C. 670) it was held that boards and planks, planed on one side and tongued and grooved, and adapted for flooring, ceiling and sheathing uses, were, nevertheless, not manufactures of wood. (See also G. A. 5627, T. D. 25715, affirmed in T. D. 27355.)

In the tariff revision of 1913 Congress eliminated from the dutiable schedules every kind of lumber named in paragraph 201 of the act of

1909 and transferred them to the free list (paragraph 647), and while it is true that neither in the act of 1909 nor in the existing law is novelty siding mentioned under that name, we are satisfied that it was the purpose of Congress in this latest revision to place all kinds of lumber—regardless of how it is treated, so long as it has not lost its identify as lumber—on the free list. Further, we are of the opinion that the terms "clapboards" and "planed lumber" are each sufficiently comprehensive to include the lumber in question.

The claim for free entry is sustained and the decision of the collector beversed accordingly.

BOARD OF U. S. GLNERAL APPRAISERS.

Logging Conditions Around Memphis

Weather conditions have been decidedly less favorable throughout the Memphis territory during the past fortnight, and particularly during the week just ended. Heavy rains have occurred in Arkansas, Mississippi, Tennessee and Louisiana, from which Memphis millmen draw the greater portion of their log supply, and their appearance has restricted work in the woods and made the outlook for adequate amount of timber rather less satisfactory. The Valley Log Loading Company reports that it is accomplishing very little in the way of loading operations, as a great deal of its machinery is idle at the moment, so that receipts of timber at Memphis, so far as the railroads are concerned, are rather less than expected. The river, however, is rising now and it is expected that the higher water stage will result in a freer arrival of logs by water, thus supplementing rail receipts at a time when these are comparatively small. There has been some stoppage of milling operations as a result of the inability to bring out logs freely but this condition is not general enough to be serious. It was anticipated a short time ago that log receipts by rail would show an increase over the corresponding period last season, but there is now considerable doubt expressed on this score as a result of the heavy rainfall of the

The Mississippi, as already indicated, is rising and the same is true of its tributaries in the lower valley. The long distance forecast of the weather and river experts is that there will be no serious flood conditions this year, but this remains to be seen. It is pointed out that the rainfall in the northern valleys has been appreciably lighter this year as compared with both of the preceding seasons and that the snow area is nothing like so large as at that time, with the result that there is less danger than usual of an abnormally high stage in the Mississippi here. In the meantime lumber interests are pleased with the prospect of some rise, for the reason that handling logs by water has been a very serious matter for some time. It has been attended by unusual expense, and much timber has been left high and dry, although prepared for shipment some time ago. This rise is regarded as a very favorable development for the double reason that logs can be handled with greater ease and less expense and that much of the timber heretofore out of reach will be brought out at an early date. The river mills are regarded as particularly fortunate, since their handling of logs this winter and during the earlier portion of spring has been accomplished with unusual difficulty.

The joint meeting of the North Carolina Fórestry Association and the Appalachian Park Association, which was to have been held at Asbeville, April 8 and 9, has been postponed. It will probably be held early in June when conditions in the mountains are ideal.

Value of Careful Lumber Piling

After nature has done her part stayed and the sawyer has attended properly to his ratios and has out humber of even thickness and with few defects, there yet remains an important work which cannot be slighted without doing damage which may offset the efforts of both the sawyer and nature. The lumber should be well piled when it is put on the sticks to season. That is a step which must be attended to with care. It is as important as the sawing.

The majority of millmen do not need advice or suggestions along that line; but some do not give the matter so much consideration as they should. They seem to proceed on the theory that the principal purpose in piling lumber is to give it a chance to season. That is one of the objects in view, but lamber should season straight and flat. Kinks, twists, and warps will spoil lumber which otherwise

would be perfect, and unfortunately much is spoiled in that way. Complaints from manufacturers who use lumber and dealers who buy and sell are too widespread to leave doubt that there is considerable ground for the charge that too much lumber is spoiled in the piling. It is put up in such a way that it seasons crooked when if it had been better piled it would have dried straight. This applies more particularly to hardwood lumber, though similar causes will produce like effects with softwoods.

The foundation should be firm and true to start with. If it is lopsided,

sunken in one part, or raised too high in another, the lumber will bend to fit the foundation, and will dry that way. After it has once set in that form it cannot be straightened and its value is lessened. Sometimes a foundation is true at first, but when the load is placed on it, one part, being on softer ground, sinks, and the whole pile is distorted. No matter how carefully the piling is otherwise done, the lumber will not dry true if the foundation is uneven.

Other things may happen to the injury of lumber, though nothing may be wrong with the foundation. The cross sticks may not be placed in line, one directly above another. It is important that they should be so, particularly if the piles are high. The weight on a stick out of line with the others will bend the boards, and they will season in that distorted shape. In small piles or where the lumber is to remain only a short time, the arrangement of the sticks directly above and below one another may not be so important; but even there it is desirable as a guarantee that the lumber will dry straight.

Sticks out of line are usually the result of carelessness on the part of those who do the piling. A stick is liable to be pushed a few inches out of place when the first boards of a course are laid, and

the careless employe may neglect to make it right. Injury of good lumber from that cause is large in the aggregate.

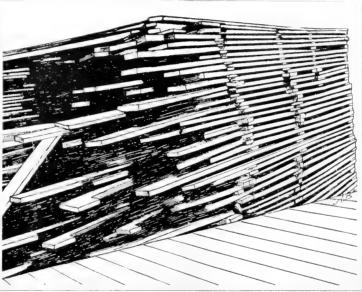

There should be, of course, enough sticks used to place them sufficiently close together to prevent the boards from sugging with their own weight. They should be hild flat on an adequate number of sticks.

There is another cause for crooked lumber that is entirely too common. One stick may be thicker or thinner than the others laid in the same course with it. Such a stick placed midway in a course will give a hump or a sag to the course next above. If it ended with a single course, the result would not be so bad, but it does not end there. The succeeding courses assume the same hump or sag, and a single stick may make a dozen or twenty courses crooked.

Too many yards overlook the importance of having the sticks

of uniform thickness. If this were carefully watched a great improvement would follow in many lumber yards.

While looking after the thickness it is well to look after the width of the sticks also. Many sticks are wider than necessary. Such a stick is not only a waste of material, and a waste of labor in handling, but it is also a waste of time in seasoning the lumber. The board dries more slowly under the stick than in the open space beyond; and it is evident that every inch of space needlessly covered by a wide stick hinders the drying of the lumber by that much.

BOARDS OF DIFFERENT LENGTHS PILED TOGETHER; CROSS STRIPS OF IRREGULAR SIZE AND POORLY PLACED. (DRAWING FROM ACTUAL PHOTOGRAPH.)

The stick, by pretty general consent, ought to be an inch thick. If thinner than that it does not provide a sufficient space between the courses of lumber for the circulation of air. The sticks should be as narrow as possible, provided always that they must be strong enough to carry the load placed on them. They must not crush under the weight of the superimposed pile of lumber nor crush into the lumber. It is claimed that if piles are of medium height, sticks one inch square will suffice.

It pays well to provide sticks of uniform thickness and width. They can be worked out rapidly on a small saw, and one man in a week should be able to true up enough sticks to equip a pretty large lumber yard. Thus all could be of the same thickness, and no lumber would bend out of shape by having thick and thin sticks in the same course. The width of the sticks is not of so much importance as the thickness, as far as keeping the boards straight is concerned; but it should be borne in mind that the use of sticks wider than necessary is not economical.

It goes without saying that the ends of boards should never protrude far beyond the last stick. If they do, they will sag and will dry in that form. If boards of the same length only are placed in the same pile there is little danger of sagging at the ends, because the state of the proceed against the centry but sometimes on several consistency services sometimes and this tortiones, and the consistency are left insupported.

First (1) vary consists may result from ansufficient case of to the proceeding cases without case are exposed to verber and they warp recases the appearance are trequently wet.

Lacker may scale; can't from causes other than twist of account of bad piling. Storms may drive rain water between the courses and it may lodge there long enough to produce warping or dishing of boards. To give a chance for drainage, the pile is usually given a pitch lengthwise. The rain sheds off, as far as the roof is concerned, but that which gets between the courses may be hindered by the cross sticks from draining away, and it will stand in puddles against the sticks until it evaporates.

Better drainage of storm water may be secured by giving the pile a pitch sidewise. The sticks will not then form a dam to hold the water from flowing away, but it will flow down grade along the sticks and escape, leaving the lumber free from standing water between the courses in a few minutes after the rain ceases. Better circulation of air is likewise secured by the side pitch of the pile. The spaces between the sticks will form flues, as it were, to draw the air through the pile.

The piling of lumber is an art with many details. Some mills have mastered it, but others have not yet wholly succeeded. The better the piling is, the straighter and more nearly perfect the seasoned lumber will be. Everything does not depend on the piling, but a great deal does; and it is one of the details of manufacture which no millman can afford to neglect. Unfortunately some do neglect

(t) and the crooked lamber too often seen in the market is one of the results. Of course, some woods are so inclined to warp and twist that it is next to impossible to prevent distortion; but there is no wood which will not be benefited by careful piling while it is undergoing the process of sensoning.

Some years ago the Forest Service made a report on the wrong methods of lumber piling, from which the following paragraph is quoted:

"Often the lumber was also very irregularly piled, and any convenient waste, such as edgings with the wane on, or short strips, was used for cross sticks. Where a strip reached only part wav across the pile, another strip, which might be from half an inch to an inch thicker than the adjoining one, would be used. The use of strips of varying thickness in the same course caused the piles to become unwieldy and twisted. When the piles assumed this form an attempt to correct the error would be made by putting in an extra strip on top of the first one. In many cases the strips were not placed in a perpendicular line-that is, each one directly over the one in the next lower course. The result was similar to that obtained by holding one end of a board in a vise and applying a weight at the other end. Again, careless pilers would run the strips perpendicularly for some distance, and then discontinue this course and begin another foot or two to the side of the original one. In other cases the foundations were insecure and one corner of the pile would sag, thus causing a diagonal twist of the whole pile. The piles were made high and wide, and different lengths were put in the same pile, which increased the natural tendency of the wood to warp and twist."

Office Furniture Abroad

United States consuls in several foreign countries have made reports to this government regarding trade in American furniture. August E. Ingram, stationed at Bradford, England, says that American office furniture is increasing in popularity there, in spite of the conservative nature of the business people. It is believed that a centrally located store or agency there would be a profitable enterprise and Bradford is suggested as the best place for it.

John L. Griffith, at London, is not so enthusiastic. He says the trade in American desks there is less than it was fifteen or twenty years ago, and that it has decreased considerably within the past five years.

At present American desks are imported in two ways—fully finished ready for the market and in knockdown and unfinished condition. The latter method is preferred by importers generally, especially those who manufacture desks of their own, for the reason that the initial cost to them is not so great, and they are able to finish the article in their own shops and place their names upon it, so that when it is sold to the consumer it apears to be a British-made desk.

If the other method is adopted by an American manufacturer, it is much better for him to establish a branch office and depot, in London for example, than to engage the services of a merchant or agent, who would probably represent other lines and would be inclined to push those which commanded a more ready sale and produced the best returns.

Some well-known American firms have already established branch offices in London and are doing a satisfactory business. However, owing to the present keen competition in the trade and to the natural reluctance of the British public to adopt quickly a new article, it is believed that a manufacturer who is not known in the English market would have to be prepared to engage in an extensive advertising campaign and to wait a considerable time for satisfactory returns.

There is a demand for high-class office desks, but it is rather limited. It appears that the class of desk which is the most popular in England sells at about 5 guineas (\$25.55).

Writing from Algiers, Africa, Consul Dean B. Mason says that the demand for American office furniture has increased considerably in Algeria during the last two years, largely owing to the enterprise of an Algerian firm that has advertised extensively and pushed sales at Algiers and at other localities through its agents.

The most important sales have been of roll-top desks, which, in order to avoid undue expense for freight and duty, are imported knocked down and unvarnished. It is estimated that there is a saving of from thirty to thirty-five per cent in importing desks in this manner.

The desirability of importing American roll-top desks was discussed with one of the leading dealers in high-class furniture of Algiers who stated that he has purchased a few American desks, set up and ready for sale, through a Paris agency, but that the price asked was so high and his profits so small that there was no object in pushing their sale. It was admitted that it would be profitable to keep a stock in supply and to push the sale of American desks if they could be secured under favorable conditions in the United States.

The dealer in question would like to secure information as to the cost of American roll-top desks knocked down and unvarnished. On account of the duty it is desired that copper parts and parts that are molded should be packed separately. Information as to the cost of shipment of ten desks from New York to Algiers is also desired.

Instances have been cited where purchases have not been made owing to the fact that it was not possible to secure prompt information as to the cost of goods delivered at the dock at Algiers.

This dealer would also like to secure information as to the cost of filing cabinets, bookeases, turning chairs, and other office furniture delivered at the dock at Algiers, knocked down, and unvarnished.

The demand for filing cabinets is of comparatively recent growth. A few important firms are using filing cabinets at present, and it is likely that their use will become more general in the near future.

The type of cabinet which has sold most readily is fifty-five inches high, fifteen inches wide, and twenty-five inches deep, and is made of wood and iron. The price paid for such a cabinet is \$23.10.

E. A. Wakefield, consul at Port Elizabeth, South Africa, says that the hot, humid climate is very trying on wooden furniture unless made of the most thoroughly seasoned wood.

The Lumbermen's Round Table

SERVICE IS APPRECIATED

There is always a good deal to be said against the plan of making contracts for lumber covering a long period, because of the possibility of the bayer "welching" in case of a decline in the market, but that this side of the situation is over-emphasized is probably true.

"Most of our business is contract trade," said the sales manager of one of the leading hardwood and veneer concerns in the West. "We have had so few refusals to take lumber or thin stock ordered from us because of price charges that we never think of such a possibility. The right kind of concerns would not attempt to break a contract if the price went down, any more than we would make that attempt if the price went up.

"Besides, the reason we can get contract business is because we are in a position to render service. We can deliver goods just when we agree to do so, and the consumer knows that this is worth something. As a matter of fact, it is worth a great deal. We get more for our stock, in the first place, by reason of being in a position to render service, than those who can give no such assurances; and this counts more with the consumer than lumber and veneer manufacturers may think."

BLACK WALNUT IN THE WEST

Oddly enough, it is the Far West which has played the most important role thus far in the revival of black walnut. A leading middle western furniture factory, which has been making up an immense amount of veneered walnut furniture, reports that by far the bulk of these goods has been shipped to the Pacific slope. The westerners seem to like the color of the wood, and by reason of the fact that it has no former reputation to live down there, as it has in the older portions of the country, it is likely to develop more rapidly on the slope than elsewhere. And the demand for furniture of that kind is likely to have a marked effect on the interior finish trade.

Speaking of walnut, Wallace Irwin, one of the cleverest of present-day writers, refers time and again to walnut in a story in the April number of McClure's, as a means of suggesting that the furniture of the home which he describes is out of date. This is the kind of publicity which the walnut people will have to counteract in some way. Had a kind friend whispered to Mr. Irwin that walnut is a high-grade cabinet wood which is still being produced at the rate of 50,000,000 feet a year, and that the finest furniture on the continent is made of this material, he would probably have referred to the design of the furniture of the old home, rather than the material.

MECHANICAL VENEER DRYING

"The greatest advantage of using a mechanical system of veneer drying," said one of the big manufacturers, "is that you can figure exactly on what your production of dry stock will be. When you tell a customer that you can ship a carload of veneers a week on his order, you know that you can do it if you are drying your stock mechanically. If you are using any other means, the condition of the air and various other factors may determine the result, and you may have trouble explaining to your customer why the goods were not shipped as promised.

"Another big advantage is absolute uniformity. When a mechanical dryer has finished its work with your stock, which has been handled under uniform conditions as to temperature, you know that it is all dried right, and that there will be no kick on part of it being below standard in this respect. By eliminating uncertainties, you have a big talking point and also save yourself a lot of worry that would be your portion otherwise."

THE LOCOMOTIVE CRANE

A southern hardwood manufacturer said recently that a locomotive crane which he installed for the purpose of sorting his logs, so that only one kind of wood would be sawed at one time, has also proved its usefulness in other ways. He is switching his cars with it and is able to place them just where they are wanted without waiting for the lordly switchman and his cohorts to come along and perform the service.

"In view of the possibility of a charge for spotting cars being put in effect," he said, "I am feeling pretty good over my investment in this crame. If the railroads decide that they will have to increase their revenues in this way, I shall simply tell them goodby and do my own sorting. This would be a considerable saving to my concern, and would not add any expense, as the locomotive is there now and condition to the work as easily as condi-

KNOWING THE CUSTOMER PERSONALLY

The head of the sales department of a caring hardwood manufacturing concern recently went out on the road with the head of the sawmill department of the same house. They visited the leading consumers of the company's products, not for the purpose of selling, but merely to get well acquainted with them.

The sales manager desired to find out just what the consumers wanted, and to learn whether any of the stock previously furnished had been unsatisfactory, in order that he might sell and deliver only lumber that would fill the bill. The superintendent wanted to study the consuming processes of the factories and get a line on just how the lumber is used, so that he might ship it intelligently.

At the same time they impressed the buyer, first, with the fact that they were anxious to give the right kind of service; and, second, that they had that kind of service to offer. By describing their facilities in detail they were able to make an impression that merely writing about them would never have created. Both representatives of the company found the trip profitable, and there seems to be no doubt that the expenditure in time and money was a good investment.

CO-OPERATION IN TRAFFIC MATTERS

If there is one point at which co-operative effort is well worth while it is in connection with traffic matters. Railroad rates affect everybody equally, and if one lumberman in a market is hurt by a change it is pretty certain that others are also. Consequently, when important traffic developments arise, there is usually a get-together movement on the part of the lumbermen, so as to distribute the cost of looking after the matter among all of the houses interested in it.

This suggests that there should be some permanent arrangement of this kind, for purposes of offense and defense. Traffic matters take some time to, work out, and cases may drag along for years before a final result is obtained. The lumberman who is sawing wood and saying nothing on the subject is likely to forget the details and be as much in the dark when the case comes up again as he was at first. If he had a traffic man to look after the proposition all the time he would be kept advised of developments and would be in a position to pass judgment upon the situation at any time, a

Some of the larger lumber markets have found the advantages of co-operation in this connection and employ traffic men permanently. Others act only when their need of immediate action is obvious. They might take a cue from clothing manufacturers in cities where the business of individual houses is not enough to support a first-rate designer; they co-operate to secure the services of such a man, all profiting by this arrangement. The lumber manufacturers, likewise, might get together and by their combined efforts support a good traffic man.

The cost of transportation is such a large part of the cost of lumber that no lumberman can afford to be without authoritative information and advice bearing on this department of his business.

Freight Car Statement

In its regular balletin dated April 7 the American Railway Association says that there was a total surplus on April 1, 1914, of 141,525 freight cars. The surplus on March 15 was 132,010 cars and on April 1 a year ago it was 68,792 cars. It can be seen that the surplus of cars had begun to increase after the temporary activity in March.

The shortage is reduced to a practically negligible figure, there being but 2,013 cars on April 1, 1914. The shortage on March 15 was 7,805 cars and on April 1 a year ago 10,084 cars.

Veneer Standards and Stock

Some years ago, when the National Veneer and Panel Manufactorers' Association was in its infancy, Lewis Doster, secretary at that time of the Hardwood Manufacturers' Association of the United States, made a little speech to a gathering of veneer and panel manufacturers at the Grand hotel. Cincinnati, in which he pointed out how they were striving to keep track of both the stock on hand among members of the association and of stock required by users throughout the country, the idea being to keep the producer and consumer in as close touch as possible.

After the meeting adjourned a prominent veneer and panel manufacturer, who has since passed away, complimented Mr. Doster on the talk he had made and proceeded to explain to him that while the idea was undoubtedly good in the lumber trade, it was not and never could be made applicable to the veneer and panel trade for the simple reason that in the veneer and panel business there was no manufacturing and carrying of stock ahead of the demand. Practically everything was cut and made up to special order.

This is recalled now as a preface to the present article to not only adorn the tale, but to help point the tendency in the veneer and panel world, which is now toward standardization and the carrying of certain stock on hand ready for prompt shipment.

Going through various current advertisements of veneer and panel manufacturers found today in Hardwood Record and other trade papers there are to be found such lines and passages as follows:

- "Panels 14", 15", 38", three-ply and five-ply standard sizes."
- "Millions of feet on hand at all times."
- "Door stock cut to size or in sheets."
- "Send for stock list."
- "Three-ply and five-ply carried in stock."

And now and then a specific listing of veneer stock on hand of various thicknesses.

In all cases these phrases may be susceptible or different interpretations and they may not always mean that certain specific sizes are carried in stock for prompt shipment. Moreover, there are people in the trade who contend just as strongly today as the contention was made some years ago that the panel business is not a business in which one can cut material and carry it in stock against future needs.

Yet the fact remains that we are gradually developing standard sizes and the stock carrying habit in both the veneer and the panel trade. It will perhaps be several more years before any great percentage of the stock made and used is cut in advance of orders and carried ready for prompt shipment, but just the same the tendency is in that direction and the trade is steadily making progress.

There is much to be urged in favor of the idea, too, that is in favor of carrying it as far as practical. One very strong argument is to be found in the persistent wrangle between panel users and panel manufacturers over the time required to get out and deliver

The panel manufacturer insists that it takes time to make up panels properly and that after they are made up and glued together they should be carefully piled on cross strips and allowed to dry from a few days to a few weeks, depending upon weather conditions and upon facilities for artificial drying of stock.

On the other hand, furniture manufacturers now and then claim they have had to take up the manufacture of panels themselves, not to save money, but to save time and to get quicker action so that they may have their panels when they need them and not have their work delayed by waiting upon some panel manufacturer. Now then, on any and all such panels and built-up work as can be reduced to standard sizes, the best answer to this is to be found in adopting standard sizes and the panel manufacturer making up such stock and carrying it ready for prompt delivery.

The tendency among furniture manufacturers has been for some time toward letting the material man carry their stock of raw material for them. This tendency is very noticeable in the lumbgr trade

and many of the lumber people serving the furniture trade not only make it a point to get prompt shipment on standard lumber stock but are even prepared to serve the trade promptly with various special dimensions, and often carry in stock dimensions that are used regularly enough to be classed as standard. Of late years the furniture manufacturers have managed to get good enough service in this quick action business from the lumber fraternity that they naturally turn with something of the same idea toward veneer and panel people and seek for prompt action.

Whether this attitude is fair and just toward the veneer and panel manufacturers is a matter that may be open to argument, but, however that may be, it is a condition that confronts the trade, and the important question of the day is how best to meet it.

There are enough people in the veneer and panel business anxiously seeking for business and trade openings and striving for the sake of business to humor every whim of the buyer that it puts the man who would fight against these tendencies in a position to lose some of his trade rather than gain his point.

One thing that even the dissenters from the idea of stock carrying in the veneer and panel trade must admit is that standardization is one of the greatest factors in modern progress and in reducing the cost of work. Every branch of industry in the world that can do so is striving to standardize every possible item in its product, not merely to establish local standards, but national and international standards. The veneer and panel industry may not offer so many opportunities for standardization as some other industries, but there are some opportunities even in the veneer and panel industry, and there are many more than have already been developed. What the trade needs is to seek them out and develop every one that has possibilities. The veneer and panel trade can do a lot along this line itself, and once the ball is started rolling properly and begins to attract widespread attention, it should be comparatively easy to secure the cooperation of all the important veneer and panel users in this work of setting forth specifically as many standards as possible to the end that the manufacturers may make up and carry in stock material for prompt delivery.

There is plenty of evidence that some progress is being made, and it is a pretty safe prophecy that more progress will be made in the next few years than has been made in the past few. How much progress and how much good both manufacturers and users may derive from it in the next few years will depend materially upon the active interest shown.

Let us cut out the unbelief, and remember that it is "can," not "can't," that does things, and we will see some substantial progress made in the next few years in the matter of standards in the veneer and panel trade that will make practical the carrying of more stock on hand ahead of needs.

J. C. T.

Still Going the Rounds

The coming timber famine fallacy which somebody started fifteen years ago and backed up with statistics, is still going the rounds. The prophets announced then that ten years would wind up the wood resources of this country, and they proved it by percentages, and cited Germany as a fearful example of timber famine. That was much more than ten years ago, and the famine has not come yet. However, the prophets are still predicting, and ten years is still named as the fatal time when the timber famine will arrive, and still Germany is pointed out as the victim of the kind of famine that is headed straight in our direction. A recent issue of Railroad Men says: "In ten years the United States will be drained of all its valuable timber." It quotes Dean Ferguson as authority, but does not state whether he is one of the old prophets or a new one, but he does not fail to point a warning finger toward Germany.

It may be asked seriously about how much longer that timber famine story is good for?

Pertinent Legal Findings

EMPLOYER'S DUTY TO WORKMEN

Although a humber company is not an insurer of the safety of its employes while at work, it is bound to use a reasonable degree of care to avoid permitting dangerous conditions to exist. The duty of safeguard machinery in a particular instance depends upon the question whether a safety appliance is practicable and in general use in similar establishments. An employer is also bound to warn a workman against all natural dangers of his work which the latter does not know or would not discover for himself in the exercise of ordinary care for his own safety. (North Carolina Supreme Court, Steeley vs. Dare Lumber Company, 80 Southeastern Reporter 963.

DAMAGES RECOVERABLE FOR BREACH OF CONTRACT

One who establishes breach of a contract is entitled to recover nominal damages, although he fails to prove any actual damage. (Texas Court of Civil Appeals, Caswell vs. J. S. McCall & Son, 163 Southwestern Reporter 1001.)

ORAL LICENSE TO USE LAND REVOCABLE

A landowner who has orally agreed to permit another to haul lumber across his land is entitled to revoke the permission at will, especially where no consideration has been received by him for the right. This is so even if the result is that the other party is thus prevented from getting his timber to market and complying with a contract of sale made with a third person. (Kentucky Court of Appeals, Elswick vs. Ramly, 163 Southwestern Reporter 751.) Note.—This decision suggests the importance to one who desires to obtain the right of hauling logs or lumber across the lands of another or having the contract reduced to writing and supported by some substantial consideration, so as to prevent revocation of the privilege before expiration of the contract period.

PERSONAL LIABILITY OF SAWMILL SUPERINTENDENT

The superintendent of a sawmill is not liable to damages for injury to a customer while on the premises, caused by negligence of employes, unless the superintendent's negligence directly contributed to the injury. (Tennessee Supreme Court, Brown & Sons' Lumber Company vs. Sessler, 163 Southwestern Reporter 812.)

REFUSAL TO RECEIVE PROPERTY BOUGHT

When one who has contracted to buy property assigns specific reasons for refusing to receive the same when delivery is tendered by the seller, he will not afterwards be permitted to assign other reasons. (West Virginia Supreme Court of Appeals, Linger vs. Wilson, 80 Southeastern Reporter, 1108.)

EFFECT OF SAWMILL CONTRACT

A cooperage company which contracted with a sawmill operator whereby he agreed to operate sawmill machinery furnished by the company, which undertook to take the product of the mill at specified prices and to advance money to meet his payroll to an amount not exceeding seventy-five per cent of the value of lumber on hand, did not become liable for the cost of lumber purchased by him, he not being an agent of the company in such capacity as to bind it for such purchases. (Arkansas Supreme Court, Gulf Cooperage Company vs. Poindexter, 163 Southwestern Reporter 1145.)

AUTHORITY OF INSURANCE AGENTS

An agent authorized by a fire insurance company to issue and renew policies has implied power to bind the company by an oral agreement to renew policies about to expire. (Kentucky Court of Appeals, Fireman's Fund Insurance Company vs. Searcy, 163 Southwestern Reporter 1103.)

CONTRACT FOR BELT LINE CONNECTION

In a suit by a hardwood lumber company against a land company to recover damages for breach of a contract to provide belt line connections for the lumber company's sawmill plant, a judgment for \$17,500 was not excessive where it appeared that for eight years the capacity of the plant was reduced from 20,000,000 feet annually to 9,000,000 feet on account of inability to procure the connection. (United States Circuit Court of Appeals, Sixth Circuit; South Mem-

phis Land Company vs. McLean Hardwood Lumber Company, 210 Federal Reporter 257.,

INJURY SUSTAINED IN UNLOADING LOGS

An inexperienced boy, seventeen years old, engaged in assisting in unloading logs from a flat car in the night-time, did not assume the risk of being struck by a log which swung around, if there was not enough light to enable him to see how the logs lay. (United States Circuit Court of Appeals, Potlatch Lumber Company vs. O'Connell, 210 Federal Reporter 434.)

TIME FOR REMOVAL OF TIMBER

When a contract for the sale of standing timber requires removal within a certain number of years, but contains a clause to the effect that the purchaser shall have "further time" on payment of taxes covering the land, payment of taxes does not give him an indefinite extension of time, and removal of the timber must be completed within a reasonable time. (Louisiana Supreme Court, Savage vs. Wyatt Lumber Company, 64 Southern Reporter 491.

AMOUNT RECOVERABLE FOR PERSONAL INJURY

Seventeen thousand five hundred dollars is not excessive recovery for personal injury to a lumber company's employe, including loss of a leg, where it appears that he was only twenty-nine years old and had previously been able to earn \$75 mouthly. (Mississippi Supreme Court, Easterling Lumber Company vs. Pierce, 64 Southern Reporter 461.)

NOTE AS PAYMENT OF ACCOUNT

When lumber is bought for, and is charged to, a married woman, the mere fact that the dealer subsequently takes the husband's note for the amount does not-constitute such payment of the original account as discharges the wife's liability, unless it is expressly understood that the note should be received in full payment. (Nebraska Supreme Court, Edwards & Bradford Lumber Company vs. Lamb, 145 Northwestern Reporter 703.)

DAMAGES RECOVERABLE FOR BREACH OF CONTRACT

Damages recoverable for breach of contract to furnish sufficient logs to cut a specified quantity of lumber at a specified price are measurable by the excess above the amount of profits actually received under the contract of the profits which would have been derived from a performance of the contract in full. (St. Louis Court of Appeals, Terry vs. Hogan, 163 Southwestern Reporter 873.)

A Forgotten Timber Trade

Digging among the mounds of ruined cities in the Euphrates valley, the excavators uncover logs of wood which formed beams and columns in palaces and warehouses. None of these ruins are less than 1,000 years old and some are much older. Some date back to the time of the Mohammedan conquest of Persia, and others long before. Particularly rich finds of that sort have come to light at Bagdad, Ctesiphon and Samaria. It recently occurred to investigators to examine those old beams somewhat carefully. It had been taken for granted that the wood had grown somewhere in the highlands north of the ruined cities and had been rafted down the Euphrates or the Tigris river. It has turned out quite different from that. The wood has proved to be teak, of species which grow in Burma and the Andaman islands, 5,000 or 6,000 miles distant from the place where it was used. Long voyages were necessary to bring it. The ships engaged in the trade sailed 300 miles or more down the Euphrates river from Bagdad, thence nearly 1,000 miles through the Persian Gulf, 500 miles through another gulf to the open sea, thence 3,000 miles across the Indian ocean, rounding the southern point of Hindustan, and thus reaching the Andaman islands, the nearest place where that species of teak grows. There is no known record of that old timber trade, but it unquestionably took place, and it is known to have continued during hundreds of years. Probably two or three years were consumed in a single voyage from the Euphrates to the teak forests and return.

London Hardwood Measurements

The Timber Trades Journal of London has been publishing correspondence in recent numbers on the subject of measurements of American hardwoods. G. A. Farber is the latest contributor to this interesting correspondence. He is chairman of the committee on measurements for the National Lumber Exporters' Association of London. He writes in substance as follows:

"I quite agree that the London system of measurements is very accurate as to widths and lengths. This has always been acknowledged; but where the great difference comes in is in taking the thickness, the dock company being entirely too technical, reducing the thickness for the smallest fraction of an inch under size. Technically it may be right; but American lumber cannot be manufactured successfully if measurements are to be made on such a technical basis and reduced to next size when found to be not full thickness over the entire piece. The American hardwood manufacturers do not make their goods for the London market alone, but for the markets of the world, including their own country, and it can be easily proved that in no other market is the thickness taken in such a technical way as in London by the dock company. Even the London merchants do not apply the dock company's technical rule, but are practical.

"Regarding measuring on the 12-foot basis, the new conditions adopted by the National Lumber Exporters' Association stipulate American board rule full contents, which does not mean 12-foot basis. The only difference between 12-foot basis and full contents system is in the fractions. These may, or may not, be in favor of the shipper, according to the fractions as they occur. The 12-foot basis was adopted for the convenience of the export trade in general, so as to show the buyer at a glance the number of pieces of each width his specifications contained, as many buyers have certain customers for certain widths, and also in order to compute the average widths quickly; it was not with an idea of any gain to the shipper. Moreover, it will be found that the 12-foot basis of measurement also shows gains for the buyer as well as for the shipper, and one should about offset the other, so there is nothing much in this. Take, for instance, a board 1 inch thick, 16 inches wide and 14 feet long. Contents full board rule, 19 feet; and 100 boards would be 1,900 feet super. If measured on 12-foot basis, 1 × 16 inches wide by 14 feet long = 16 feet, and 100 pieces would be 1,600 feet, add one-sixth to bring it to 14 feet = 1,866 feet, showing a difference of 34 feet super against the shipper. The difference is simply a matter of fractions occurring most often for or against either method.

"Referring to the suggestion that goods measured in merchants" vards are measured as tightly as possible for selling purposes, and not done so carefully as when measured by the Port of London Authority. American shippers are selling their wood to the merchants, and not to the Port of London Authority, and there is no reason why any consumer should receive a tighter measurement on goods that have not been measured by the dock company than goods that have. I do not know a fairer lot of men than the London merchants, and I do not believe a single one would ask a shipper to accept the dock company's measurement, and re-measure the goods tighter for selling purposes, if he knew that the dock company's measure nearly always shows a shortage on shippers' measure. The trouble is not with the London merchants; it is with the London hardwood brokers dealing in American hardwoods. They do not wish to change old customs, and the small effort exerted by them to bring the London merchants to meet the National Lumber Exporters' Association Committee on Measurements more than a year ago was very evident of the lack of interest taken by the brokers to help American hardwood shippers to secure more even measurements in London.

"Regarding the 1½ per cent shortage referred to, the writer of the letter wishes to know why the buyer should pay for something he does not receive. This is not the intention of the shipper, and if it were the buyer has the remedy in his own hands. He can allow for the 1½ per cent shortage in the price he offers. Surely there must be some give and take in the matter of measurements of lumber. There are on an average more than 1,000 pieces of lumber in an American carload, and no two men can measure them alike, or in exactly the same place, and there must be some difference.

"As to the question of thickness which the writer of the letter refers to, it is evident that he knows absolutely nothing about the manufacturing of American hardwoods on the high-speed mills in the States, or he would not make the statement he does. If the London trade expects to receive American hardwoods sawn exactly to thickness when dry, they may as well import the logs and saw them in the United Kingdom where the sawing is perfect. Shippers can supply only what they can produce, and buyers, I feel sure, understand this. The writer of the letter states that some shippers do cut their goods full thickness. If he means every piece is full thickness, I take exception to this, especially as to shipments from the southern states, such as Mississippi, as even though the wood is cut full thickness when it falls from the big saw, it does not all dry with the same shrinkage, owing to the different texture of the wood—I refer chiefly to plain and quartered oak."

Natural Finish for Black Walnut

In endeavoring to analyze the reasons for the falling off in the demand for black walnut, it seems to be the consensus of opinion that it can be traced directly to wrong methods of finishing. No one will maintain that the old sombre American walnut furniture as it used to be finished in dull black tones, was really fitting for anything that was designed to furnish the abode of mankind, more specifically the home. The old wood finishers were laboring under some false idea of beauty or probably they did not investigate the possibilities of wood finishing to the extent that would enable them to turn out an article that would really be pleasing to the eye. It is really difficult to find any logical reason for the character of finish that used to beput on walnut furniture of various kinds.

However, this has all been changed. Even if the furniture and piano dealers and others actively engaged in marketing home furnishing products did not take an active enough interest or did not fully appreciate the potential possibilities in walnut, those whose money was invested in producing lumber and veneers of this wood have realized its possibilities and have given it close study. As a result they are gradually winning over the producers of furniture, interior finish, etc., to their way of thinking, and are gradually prevailing upon them to try out the market with modernized walnut products, so finished that they are really beautiful objects.

That their efforts are bearing fruit is absolutely proven by actual statistics regarding the production of walnut. Five or six years ago the output of walnut could be conservatively placed at 35,000,000 and 40,000,000 feet a year. One of the biggest manufacturers in the walnut business, a man whose fingers are on the pulse of the consuming trade and who is in a position to know what he is talking about, says that last year the production, figuring conservatively, was no less than 50,000,000 feet, of which 35,000,000 to 40,000,000 feet was exported. Thus it can be seen concretely that the actual production is increasing, and of course it is reasonable to suppose that this increase in production means an increase in demand as the outputs have been marketed.

In this connection it is interesting to cite a few specific cases which illustrate the increasing demand for walnut products. One large Indiana furniture manufacturing concern states that at the January Chicago exhibits, its sales for bedroom suites made up in American walnut in the natural finish, were more than the sales combined for mahogany, white enamel and quartered oak stock. This seems to be a pretty strong statement, but it comes directly from this concern and is absolutely a fact. It can hence be readily appreciated that there is a real and growing stimulus in the demand for walnut furniture and similar articles.

Right Pay for Lumber Salesmen

Most traveling salesmen of lumber concerns are paid a salary and expenses. In many other lines manufacturers and jubbers have found it advisable to put their men on a commission or salary and commission basis, believing that only by this means are they certain of getting aggressive, enthusiastic effort from the salesman all the time. The question naturally presents itself, which is the better plan?

Advocates of the commission idea point out that the average salesman, like most everybody else on this mundane sphere, is working chiefly because he has to. With his earnings fixed in advance, and a definite limit placed upon them, for a time at least, is he not likely to loaf on the job and do only as much as necessary, rather than as much as possible?

That is the theory of the proposition; and in other lines of business all kinds of devices have been provided as a means of stimulating the salesman to greater and greater exertions. The plan always is to keep the traveler from getting into a rut of self-satisfaction, and to supply a mental spur which will keep him working at top of his ability.

It is true that in other departments of industry payment according to production is getting to be the rule, rather than the exception. Hardwood Record has explained the various piecework plans used in the lumber yard, and in this connection it is worth recalling that such plans have not only enabled the lumberman to get his stock handled more cheaply, but has also given the workmen more money, thus benefiting both. In retail stores almost everywhere some form of the commission is seen in the p. m. or premium system, by which the salespeople get special rewards for moving goods which are either going out of style or which have proved to be "stickers."

Did you ever notice special eagerness on the part of a shoe salesman to sell you a pair of shoes you didn't want? The chances are that he had a p. m. coming to him if he sold that particular pair, and of course he did his best to earn the commission.

In the furniture business the plan is to pay the traveling salesmen five per cent on their sales. They pay their own expenses out of this. A few of the big houses with well-established trade send their men out on salaries, but this is the exception and not the rule. One of the chief advantages derived by the manufacturer from this plan is that his sales cost is known in advance. It is five per cent—no more and no less. Does the lumberman know how much it will cost him to sell the stock on his yard?

One manufacturing concern in another line believes in the commission plan to such an extent that it has worked out a profit-sharing scheme, whereby each salesman is paid in accordance with the amount which the house has made on his sales. This is one plan which it might be worth while to apply to the lumber business. The house knows the factory and overhead cost of every item sold, and knows the salary and expense account of the salesman. These costs are deducted from the sales, and the salesman is given a percentage of the profits. That makes for care in placing the right kind of business with the right kind of consumers, and keeps the salesman from selling the easy ones without regard to pushing the profitable lines.

Getting down to the facts, however, it must be admitted that the Iumber business is different from most other lines. For one thing, prices are elastic, because every consumer wants something different. For another thing, there is always more or less dispute regarding grade and measurement. That means that the salesman, being the ambassador and diplomatic representative as well as the order-taker, must spend part of his time adjusting differences between the house and the customer.

Obviously, it would not do to have a commission salesman on the job in a case of this kind, where the salesman must act for the best interests of the house. He would probably be too anxious to make another sale to be willing to spend much time looking after the customer whose business had already been taken care of.

The matter of which lines to push is probably as important as any other one consideration in deciding the lumberman to pay salaries to his salesmen instead of commissions. The lumber business requires

careful handling, so as to keep the stock moving evenly. It wouldn't do to sell nothing but plain oak, even though the market on that item were good, and let a big accumulation of chestnut remain on the yard. The efforts of the salesman who is a real salesman and not merely an order-taker, must be delicately adjusted to the condition at the mill or yard, so that he will sell the lumber which needs to be sold and not merely that which can be moved most easily.

The man on commission has no incentive to hold up prices. He is out to sell lumber and he will sell it for as little as the lumber concern will take. His plan is "quick sales and small profits," only the small profits are for the lumberman, because his own are uniform, depending only on the values involved and not on the margin to the handler. As stated, there are as many prices, almost, as there are consumers, depending on the special requirements of each factory. If the lumberman finds that his stock is being offered on a rock bottom basis to everybody, regardless of the kind of material needed, he will speedily realize that most of the business being turned in is of the dollar-swapping variety.

Still another objection to having a salesman on commission is that of credit hazards. The home office, of course, must be the final arbiter in all cases where credits are concerned, but the man who is getting a salary and has no incentive to get any business except that which is best for the boss is not going to offer lumber to a concern which he thinks is likely to cause trouble when it comes to paying for it. The commission man is always willing to take a chance, because it is the house, and not he, that is taking the chance.

From all of these standpoints it seems that the lumber business is sui generis, a rara avis and a good many other untranslatable things. It is done in a fashion which is dissimilar from that of any other business. The man who sells a bill of goods in any other line seldom has to do more than make the sale. The possible range of quality is so small and the needs of the buyer are so standard that it is next to impossible for even a tyro to make a bad mistake. But turn loose a salesman who knows little or nothing of lumber, and see how speedily he can tangle up the firm's business!

"The fact of the matter is that our salesmen are more than salesmen," said the head of a leading hardwood concern, which sells all over the northern and eastern portions of the continent, and has half a dozen salesmen covering the principal consuming centers. "They are our representatives in all that the word implies. They must act for us, not merely as to sales, but as to matters of policy. They must be able to speak for us as to many things, and then to advise us as to the special requirements of each customer.

"In order to get this kind of service we must pay for it. We cannot expect a man who is paid merely to sell to spend a great part of his time doing missionary work. And yet that is what we want our road men to do. That means a salaried job. It is possible that our men are less aggressive than they would be otherwise; but, on the other hand, they know that they must sell lumber in order to stay on the pay-roll.

In this connection it is worth noting that this house has recently organized its sales department more thoroughly, appointing a sales manager to do nothing except look after that end of the business. Heretofore the general manager has had to supervise manufacturing and yard operations, as well as keep six salesmen on their toes, and he has found the job too onerous. The man who is studying sales only, like the man who is devoting all his time to running the mill, can do better work in that particular capacity.

The forestry students in the Michigan Agricultural College did not encounter any of the "spicy breezes" which "blow soft o'er Ceylon's isle" while engaged in this winter's field work. They went up among the mountains of West Virginia where the laurel is buried under three feet of snow and the spruce trees are icy pinnacles, and there they put into practice some of their class room instructions, and got close to the heart of nature at a time of year when most people prefer to be close to the stove.

Need of State Forestry

In an address before the thirty eighth annual meeting of the Minnesota State Forestry Association, J. Garvin Peters, who represented the work of state and national cooperation in forestry, outlined the field which state forestry ought to occupy in this country. He insisted that four things should be considered in taking up forestry problems. First, the bulk of our forest lands are in private ownership: second, these private lands are overcut; third, there is a general lack of forestry practice on the areas cut over; and fourth, it takes such a long time to produce a forest crop.

The area of absolute or permanent forest land in the United States, that is, land which will grow trees but is unsuited to agriculture, is probably 450,000,000 acres. Of this area, private owners hold approximately seventy-five per cent. It is clear, therefore, that the bulk of our future timber supply must come from these privately owned lands. It cannot continue to come from the countries now exporting timber in large quantities because they will soon have no more to spare.

Mr. Peters stated that the annual cut per acre is forty cubic feet, while the growth does not average more than twelve; but that with scientific management the annual growth could be brought up to forty or even fifty cubic feet per acre. With few exceptions, no forestry is now being practiced on cutover lands in this country, while fire is reducing many areas to barrens.

This is the land which states should own. The care of it is usually too burdensome for the individual owner, and returns are too far in the future to attract private capital. The speaker pointed out some of the obstacles in the way of immediate public ownership of large areas. Large sums of money to make the purchase are not available, and public sentiment is not yet strongly demanding that the purchase be made. Some states, however, have taken energetic measures to protect forest land, even though the states do not own it. Oregon, for example, has a compulsory fire-patrol law for private land, and New York, Minnesota, Washington and Oregon have laws regulating the piling of slash. Nevada regulates the size of trees which shall not be cut, and Maine exercises certain supervision over forest lands privately owned. Several other state legislatures have bills pending which seek to regulate such lands for the public good.

Some states, practically all in the West, already own large forest areas of land grants, which they have not yet disposed of. The establishment of public forests by these states is, therefore, a simple problem as compared with that confronting the older states which have long ago parted with their lands for a mere song and must now go into the open market to buy them back, minus the timber, for many times the original selling price. These older states furnish very striking examples of a mistaken land policy, which it is not too late for the newer ones to heed.

Mr. Peters pointed out that between state and federal ownership of forests there is this distinction, namely, that the former may be managed entirely in the interest of the individual state; the latter, in the interest of the nation as a whole. But there is every reason for the closest coöperation between both agencies. State forests are necessary to supplement national forests, and the efforts of both state and nation will accomplish none too much. The demand in some quarters for state control of the national forests is simply a movement to turn their vast resources over to private interests.

As a national remedy for a fast dwindling timber supply and for lack of protection to the watersheds of navigable streams the states should assist and supplement the government in acquiring ownership of the forests. While these problems are of the greatest importance to the whole country, they are none the less ones in which the individual state is vitally concerned also.

Public ownership will guarantee a stable administration of the properties. They will be removed from the possibility of change of ownership. The successful application of forestry methods can only be secured in the long run under ownership which is permanent and long-lived.

A stable lumber industry will be assured giving steady employment to the wage-earner. Areas now in waste and barren land will be reforested, and the crop in time harvested on a basis of the annual yield. The large mill which clears the land and moves on to other fields, often into distant states, leaving behind deserted towns, will be a thing of the past. Instead, there will be mills, perhaps not so large, doing a permanent, steady business.

Mr. Peters quoted items of cost and profit in a number of foreign countries which have managed their forests a long time, and it was shown that the operation can be made profitable to the state, in addition to the advantages which will come to the people by having a necessary supply of timber.

Traffic Matters Around Memphis

the hearing in the case involving the proposed western rate advance of one to three cents per hundred pounds on shipments of hardwood lumber and products made therefrom, which was to have been held in St. Louis April 1, has, at the request of the carriers, been postponed until June 1. The date for the effectiveness of the proposed advances, which were suspended by the commission at the request of the Southern Hardwood Traffic Bureau, has been advanced to December 1, so that there will be plenty of time in which to prepare the necessary data to be used in combatting the higher rates. There were only a few days intervening between the announcement of the date for the hearing and the hearing itself, and the Southern Hardwood Traffic Association is congratulating itself over the postponement. Officials will at least be able to work on the subject diligently and with some assurance of successful opposition, now that they have a number of weeks to devote themselves to the issues involved in this hearing. It is estimated that hardwood lumber interests in the southern territory will have to pay about \$1,500,000 more for freight service if the higher rates are sustained and there is no denying that everything that can be done in the way of opposition will be vigorously pushed by the officials of an organization that never does things by halves and that has a long record of victories to its credit. It is realized that this is one of the "big cases" before the commission and hardwood lumber interests are preparing to make the fight of their lives when the hearing begins June 1 next.

In the meantime the bureau will have its hands quite full preparing for the hearing in the case of the Bellgrade Lumber Company, which has been set for April 27 at Memphis. This will be before J. T. Hines, special examiner-attorney for the commission. It involves the securing of rates of eleven and ten cents, respectively, on shipments of hardwood lumber and lumber products from points above and below the main line of the Southern Railway in Mississippi to New Orleans. About a year ago rates of eleven and ten cents were made applicable to gum and cottonwood from the localities already defined to that destination and the Bellgrade Lumber Company is seeking to obtain an order from the commission directing the defendant roads, the Illinois Central and Yazoo & Mississippi Valley, to apply the same rates to all hardwood lumber shipments. The hardwood lumber interests of Memphis recently decided upon the filing of an intervening petition, to be heard at the same time as the case of the Bellgrade Lumber Company, through which a rate of eleven cents is sought on all shipments of hardwood lumber and lumber products from Memphis to New Orleans as against the present rate of twelve cents. It is pointed out that, if the Bellgrade Lumber Company is successful, Memphis, which lies only a few miles above the Mississippi state line, is entitled to the rate of eleven cents which will become applicable on shipments from that boundary to New Orleans. The intervening petition is in the name of the Anderson-Tully Company. The Southern Hardwood Traffic Association will have charge of both of these cases. J. R. Walker, attorney of the bureau. will come from Washington to assist J. H. Townshend, general' manager, when the hearings are called.

The Mail Bag

Any reader of HARDWOOD RECORD desiring to communicate with any of the Inquieres listed in this section can have the addresses on written request to the Mail Bag Department, HARDWOOD RECORD, 537 South Dearborn Street, Chicago, and referring to the number at the head of each letter and enclosing a self-addressed stamped envolepe.

B 707-Wants Wagon Oak and Hickory Dimension Connections

Winnipeg, Man., April 1.—Editor Hardwood Record: You will undoubtedly remember the writer as having been previously located in the Fisher building, Chieago. We have recently decided to add a hardwood department to our business and wish, among other things, to locate one or more good shippers for wagon oak and hickory dimension. The writer will consider it a personal favor if you will give him any information that you have on this, as we are rather isolated up here and are not in a position to get information as easily as if located in Chicago.

The writer of the above letter was formerly a prominent member of the Chicago hardwood trade, and is now located with a first-class wholesale hardwood concern at Winnipeg. This should be a valuable connection for a good American concern. EDITOR.

B 708-Wants Market for Cherry and Rock Elm

Hanover, Ont., April 6.—Editor Hardwood Record: We have one carload of dry 4/4 cherry, No. 2 common and better. Also 5 cars 6/4 and 8/4 rock elm, No. 1 common and better, and we will have 8 or 10 cars more during the summer months and could saw to order. As we do not use any of the above in our works, we want to sell, and if you will give me the name of a reliable manufacturer who would use these woods we would be pleased to hear from you.

A list of a few users of this material has been supplied the above. Anyone interested can have the address on application.—EDITOR.

B 709-Wants Addresses Rim and Spoke Manufacturers

Lexington, Va., April 1.—Editor Hardwood Record: Will you please furnish me at once with the address of several wheel manufacturers who use hickory for rims and spokes? We have a fine lot of logs and want some western buyers.

This concern has been supplied with a short list of possible customers in this line. Others interested can have the address by writing this office.—EDITOR.

B 710-Wants Kiln-Dried Quartered White Oak Dimension

Grand Rapids, Mich., March 30.—Editor Hardwood Record: The writer was interested in your article on page 33, current number, headed "Furniture Factory Short-Cuts," and would ask you to kindly advise us, or have the writer of this article advise the names of a few concerns carrying kiln-dried dimension stock, especially in 4/4 quartered oak lengths 49 and 55 inch, white oak being all that is of interest to us.

The concern writing this letter is one of the best known furniture manufacturers in the business and has been given the names of some people who could possibly supply it with this stock. Others interested can have the name and addresses on application to HARD-WOOD RECORD office.—Editor.

B 711-Wants Inch Basswood S1S

Coldwater, Mich., April 1.—Editor Hardwood Record: We are in the market for the following stock:

14,000 pieces 4 x22: 22,000 pieces 4 x23½
43,000 pieces 54x29: 30,000 pieces 5½x39
3,000 pieces 6%x31; 44,000 pieces 6%x31
6,000 pieces 6%x42; 1 inch basswood surfaced one side to

6,000 pieces 6%,742; 1 inch basswood surfaced one side to 5/16, clear of all defects. If you can put us in touch with any mills who might desire to contract, we will consider it a favor.

The company is a well-rated remanufacturer of hardwoods, and this offers a good opportunity for those in a position to figure on such an order. Anyone desiring to know the identity of this company can have its name on application.—EDITOR.

B 712-Wants List of Manufacturers of Plow Handles

The concern writing this letter is a well rated manufacturer of carriages and wagons, agricultural implements, etc. Anyone desiring the name and specific address should write Hardwood Record.—Editor.

B 713—Wants to Buy Popple Lumber and to Sell No. 2 Common Cherry

Noblesville, 1991, March 29. Editor Hydawson R. 619. Can you give us the names of manufacturers of popple lumber, and also the names of parties who use 4.4 No. 2 common cherry?

A possible source of supply for popple lumber has been suggested to the above and a few users of cherry also supplied. Anyone interested in negotiating with this correspondent will be given the name upon request.—EDITOR.

B 714-Wants Information As to the Use of Hardwood Offal

New York, March 25.—Editor Hardwood Record: We are taking the liberty of addressing you, believing that you can give us some information we are seeking.

We are desirous of learning the uses to which wood offal is put. The offal we have in mind consists of hardwood, chiefly oak, and amounts to a little over three tons daily, half being sawdust and the other half being slabs, edgings, etc. Of course, offal is utilized in making charcoal and recovering the by-products, and we understand, it is also used for making briquettes. However, as the amount involved is comparatively small, we do not know whether it would be profitable to use it for these purposes. Possibly you can inform us more definitely in this matter, and also suggest the most profitable uses to which this offal may be pur-

We do not desire to put you to any great trouble, but any information you can give us on this subject will be appreciated very much. Thanking you in anticipation, we remain.

THE NATIONAL ASSOCIATION OF MANUFACTURERS.

The above has been advised that it is true that such material has been utilized in making charcoal and recovering by-products. The best results have been secured from the processes of distillation with the use of such woods as birch, beech and maple, oak not having produced so well. In the manufacture of charcoal, of course, oak is an excellent material.

The by-products proposition in hardwood to be feasible is rather dependent upon good sized supply of raw material, i. e., offal, but inasmuch as it is stated that the supply on hand is limited, it is difficult to see how this product can be utilized except in the manufacture of small stock of various kinds from the slabs directly through suitable machines and success in this is dependent upon favorable circumstances.

The manufacture of dimension stock in this country is of ever increasing importance, but the pursuit of this business on a paying basis has been rather difficult on account of inadequate prices realized.

This correspondent has further been advised that he could hardly profit by attempting to utilize this offal in any other way than by mere mechanical remanufacturing of good sized slabs, and by the utilization of the stuff as firewood if it is near enough to market.—
EDITOR.

Clubs and Associations

Southern Hardwood Traffic Bureau Changes Name

"The Southern Hardwood Traffic Association" will henceforth describe the organization operating in the Interests of southern hardwood lumbermen, previously known as the Southern Hardwood Traffic Bureau. This change was adopted at a meeting held in Memphis on March 21.

Michigan Manufacturers to Meet During Forest Products Exposition

J. C. Knox, secretary of the Michigan Hardwood Manufacturers' Association, Cadillac, Mich., announces that the next meeting of the Michigan Hardwood Manufacturers' Association will be held in Chicago some time during the Forest Products Exposition, which will be in session here from April 30 to May 9. The subject was put to a vote of the members of the association, and a sufficient number of affirmative replies were received expressing a desire to attend the Forest Products Exposition, and also take care of the quarterly meeting at the same time. The specific date has not yet been announced, but will be in due time.

Meeting Philadelphia Exchange

The last monthly meeting of the Lumbermen's Exchange, before the annual, was held April 2, President Beujamin Stoker in the chair. A communication from the Pennsylvania Manufacturers' Association was received at this meeting asking the exchange to send delegates to the convention to be held at the Believue-Stratford hotel, April 3, for the purpose of discussing and agreeing upon a workmen's compensation bill. A resolution directing the president to appoint a committee was passed,

With the replies from the railroad officials that have thus come in.

we have snain addressed a letter to them covering this matter norefully. Before many meetings of this association shall have passed
we hope to be able to furnish you with a definite "time schedule of
lamber from every road, not a schedule to be used for soliciting freight,
but a schedule of usual average performance, which will give rou a
working basis. When the officials of the carriers understand that this
is what we want we will get it, and they will be very glad that the
natter was brought to their attention. Further than that we hope to
have a little directory of those to whom you should look for information
when such is desired. Too many of us today do not know this and
officials.

TWO IMPORTANT DETAILS.

But gentlemen, the replies to our letters brought out two important details wherein the lumbermen can greatly help the railroad and it religiously to inform on wherein lumbermen made mintakes. There do it very emphatically. There are two in number: 1. Starting travers as soon as lumber is shipped. 2. Not reconsigning lumber outs the cars arrive at destination. Here is where we, as lumbermen, can of material help to the railroads and can show that we are which is being given for rate advances, and you think of the value which is being given for rate advances, and you think of the value of instead of the association permitted han offered to cooperate with the railroads in various there is no doubt on that subject. On tehalf of the association permitted han offered to cooperate with the railroads in various the results of the subject of the continual travers as soon as cars are supped, provided they we sending travers as soon as cars are supped, provided they we sending travers as soon as cars are supped, provided they we sending travers as soon as cars are supped, provided they we sending travers as soon as cars are supped, provided they we send the time substitute and for the association permitted the results of the supperson the provided that we we send the provided that we we send the provided that we we send the provided that the read to the provided that we we send the provided that the read to the provided that we we send the provided that the read to the provided that we we send the provided that the read to the provided that we we send the provided that the read to the provided that we we send the provided that the read to the provided that we we send that the provided the provided that the provided that the provided the provided t

The different substantial was arrive we are journels of the different that they was a respectively and the different that they was a respectively and the different transport of the di

have the committee stands absolutely on the ground that the committee stands absolutely on the ground that the committee stands absolutely on the ground that the committee of the continuous are the creads that should be a committee. You want to not make from time to time as to what rads there are and we know that you will be very glad to give to times reads the traffic which you control.

It is not not not continuously to the committee of cooperation, wherein the cummermen may understand the carriers desires and wherein the carriers may understand the importance problems. Heretofore this at an each continuously of the supplied and much of our trouble will be at an each continuously of whitese committees the state of the sta

at an end the supplied and high of our trouble will be have been applied to the same of the supplied and spotter degree we attempted to have Mr. Barrow of the Association of Commerce here, but he was called to Washington. The latest word appears to be that the commission is no severy deep and the country is pressing for such an early decision to the tree per east rate advance question that it will have to let it per to clean, at least for the present most of the commission appear to be against the charge and surely the shippers and many of the rainfalls are so for the immediate present there will be no need to worry.

John Claney, chairman of the fire limits extension committee, said that the maintee has been working with might and main in the interests of that work with the hope of keeping the fire limits extension within reasonable proportions. Mr. Claney said that about thirty-five equare miles were embraced in the extension of limits in June, 1912. and that there is now before the sub-committee of the city government a resolution to further extend the limits. Mr. Claney said that figures on the so-called semi-fireproof construction, maintaining that the cost is only about five or six per cent greater than wood construction, are erroneous, and he placed the increased cost at about from twenty-five to forty per cent.

President Crow then spoke of the work being done to entertain visitors in attendance at the Forest Products Exposition, stating that the committees appointed by the association had met on March 19 with Secretary Rhodes of the National Lumber Manufacturers' Association and Manager George S. Wood of the Exposition, and that the lumber a-sociation had secored a booth with the idea of making arrangements to extend a cordial welcome to visitors.

H. D. Welsh, chairman of the entertainment committee, then reported, outlining its work and the work connected with the Forest Products Exposition.

After that discussion it was reported that four association meetings would we held during the year, the division meetings to take place as menai

E. A. Thornton, speaking of the proposed move of the Lumbermen's Club to the proposed lumbermen's building, said that it will be necessary to have seventy-five additional members before entering into a lease with the McCormick estate. Mr. Thornton expressed himself as believing that this additional membership could be secured in time.

The meeting then adjourned.

Monthly Meeting of Cincinnati Lumbermen's Club

A very well attended and enthusiastic meeting of the Cincinnati Lumbermen's Club was held at the Hotel Gibson, April 6. The new quarters of the Automobile Club in the hotel were recently opened and on invitation of the auto boys the lumbermen held the meeting in their new home. After the usual course dinner was disposed of, the meeting was called to order by President Hagemeyer. Among the committees that made reports was one appointed to protest against the proposed charge for spotting cars. The members were glad to learn that the matter has been stopped temporarily at least. The square deal policy of the club was again in evidence, a matter in dispute having been settled between one of the club members and a prominent New York concern.

The club went on record as being in favor of the proposed advance of 5 per cent in all freight rates, and the secretary was instructed to so notify the Interstate Commerce Commission. Another matter of impor-'ak-a up was the club's endorsement of the bill now before Congress H. R 14324, introduced by representative A. J. Sabath, of Chicago, and providing for the prosecution of any or all persons using the mails of the United States for the transmission of false statements in an effort to secure credit. The matter came up in the shape of a communication from the National Wholesale Lumber Dealers' Association. because is asking all assistance possible in an effort to have the bill passed. I - measure also has the endorsement of the National Credit Men's escuation of New York. The Lumbermen's Club heartily endorsed the responsition and instructed Secretary Bolser to write all of the congress-" the destroy and those congressmen composing the committee to . . referred, requesting their support of the measure. B. N. offset it to Vine CLLO CLLO set it is apparently impossing each of N. offset in CLLO Set it is apparently in finishing and iterations of the Set is a set as well as a fixed the most investigation of the CLLO Set in the CLLo Set i This brought forth much discussion and many suggestions, including the securing of a very attractive young lady as keeper to welcome the visitors, including the members of the club, and, if necessary teach them how to tango, dance the besitation waltr and perform other feats. This suggestion appealed particularly to S. M. Nickey, chairman of the law and insurance committee, who is now taking dancing lessons in order that he may participate in the numerous social functions to be given by the club. It was pointed out that at present these rooms are particularly beautiful but that they are unattractive for the reason that nobody likes to be all alone. It was also emphasized that, after incurring so large an expense, it was bardly going to allow the rooms to remain practically without value to the club. They were designed for the double purpose of giving the members a place to meet informally and to advertise the beauty and utility of the woods manufactured in this section for interior decoration and finish. But there is no attendance so far on the part of the mem ers because of the loneliness to which reference has already been made and there is no one to welcome visitors and therefore there are few who go there. John M. Pritchard, secretary of the Gum Lumber Manufacturers' Association, said that he had taken several contractors and architects to visit the rooms and that they in turn had taken some of their customers, all of whom were duly impressed with the interior and the woods used for that purpose. He said that he intended writing letters to all the architects, contractors, builders and prospective builders, asking that they visit the rooms and learn for themselves something of what can be accomplished in the way of paneling and other decorative work with the material at hand. In this he has the hearty indorsement of the club members. Others suggested that a sign in gold letters "Visitors Welcome" be placed on the door leading to the rooms while it was likewise suggested that placards should be placed in the hotels and other public places calling attention to these rooms and requesting that they be visited for purposes of inspection. All of these suggestions, however, were turned over to the board of directors and the whole magter was referred to them, with the request that they bring in their recommendations to the next meeting of the It is practically a foregone conclusion that some one will be permanently employed to look after these rooms and show them to visitors and, after listening to the arguments for and against both men and young ladies, it is practically a cinch that one of the latter will be secured. The rooms are beautifully furnished and elegantly finished and the club Is determined that it shall get good value out of them.

S. M. Nickey and S. B. Anderson brought to the attention of the club the importance to manufacturers of the annual of the Tengessee Manufacturers' Association held in Nashville, April S and 9. So far as the club is concerned, the subject was disposed of through instructions to the president to empower every lumberman from Memphis who attended the annual in question to act as a representative of the Lumbermen's Club of Memphis, to the end that the interests of its members may be properly looked after.

The entertainment committee was, on motion of John M. Pritchard, nuthorized to prepare another entertainment similar to the one recently given at the Hotel Chisca by the Lumbermen's Club. The committee is to select the date and announce this to the members, all of whom are cordially invited to participate. The entertainment is to be a cross between a cabaret show and a tango party and the members, both old and young, are looking forward thereto with much pleasure increasing in intensity in accordance with their ability to dance all of the new steps.

Swainke, Theriton, Wis.; J. V. R. Evensender, Wiss.; J. S. Wesdman, Jr. Trout Creek, M. Ch., A. C. Wells, Menomines, Mich.

This will be the largest as well as the most interesting meeting ever held by the National association, and it is specifically requested that both delegates and alternates attend and participate in the proceedings. meeting will be held in connection with the Forest Products Exposition in Chicago

Hardwood Timber of the Solomon Islands

Some very valuable timber is contained in the Solomon Islands, a British protectorate in the Pacific Ocean, containing seventy-eight islands with an area of sales square miles. So far very little has been done to establish an export trade, although spasmodic attempts have been made from time to time to introduce Solomon Island timber on the Sydney market

There is one timber known as dilo timber, which seems to have found a considerable market in furniture making. Of this there is practically an inexhaustible supply

The timber of the afrelia bijuga appears to be absolutely impervious to the attacks of the white ants, and almost impervious to teredo. This the grows we rywhere in the Solomons and reaches a diameter of two port. It Could serve as an excellent what's and pile timber, and also as railway sleepers.

Another valuable timber closely allied to the "kauri" at New Zealand is known to exist in certain places, and propositions for putning it on the market are being considered. There is a good demand for this class of timber and it will certainly be put on the market at a lower price

With the Trade

New York Mutual Casualty Company Formed

The Lumber Mutual Casualty Insurance Company has been formed it. New York by men prominent in the lumber business. The new compensation law makes it compulsory for business men to carry insurance of this kind and it is the purpose of the Lumber Casualty Company to specialize in compensation insurance for the lumber trade.

The final organization was effected at a meeting held in the office of E. F. Perry, New York, on March 14. At this meeting M. E. Preisch of the Haines Lumber Company, North Tonawanda, was elected president to serve until the annual meeting in April. The other officers elected are:

VICT PRESIDENTS E. F. Perry and Horace C. Mills. SECRETARY LOUIS H. Parker. ASSISTANT SECRETARY LOUIS H. Parker. TREASURED. Charles F. Fischer. Actuary H. F. Still.

TREASUREE Charles F. Fischer.
ACTIMS II. F. Still.
COUNSEL D. Theodore Kelly of Conway, Williams & Kelly.
EXECTIVE COMMITTEE—Martin J. E. Hoban, Rufus L. Sisson, R. R.
Griswold, A. R. Carr, Frederick Cleveland, with president and general
manager cs officio members.
The company means to write compensation insurance for the lumber

trade at rates that will be no higher than those of the stock companies, while careful management in the selection of risks with an eye single to "safety first" will mean a saving in the shape of annual dividends to policy holders.

Passing of Frederick Weyerhaeuser

In the death of Frederick Weyerhaeuser, of St. Paul, Minn., the lumber trade lost a man who has done more for its development probably than any one individual in its history. In the life of this man can be traced the real history of the lumber business, as he started in the lowest capacity and eventually at the age of seventy-nine had attained riches which yied with if not exceeded those of John D. Rockefeller. Mr. Weverhaeuser succumbed to a sudden attack of pneumonia at Pasadena, Cal., on April 4. The body was placed aboard a train later and sent to Rock Island, Ill., his old home, for interment.

Mr. Weyerhaeuser had caught a severe cold which developed alarming symptoms, but after his children were sent for he seemed to be on the road to recovery. However, a relapse occurred which took him off rather suddenly after his sons, John, Frederick, Rudolph and Charles, and daughters, Mrs. Margaret Jewett, Mrs. W. B. Hill and Mrs. S. S. Davis, had reached his bedside.

Mr. Weyerhaeuser came to this country from Neidersaulheim, Germany, where he was born November 21, 1834. His immigration occurred at the time he was eighteen years of age and after his father had died.

His family migrated to Eric County, Pennsylvania, and his first employment was with a brewery. This work did not last long, however, and he next became a farmer, earning \$13 a month.

His family eventually moved to Coal Valley, Rock Island County, Ill., in 1856, where Mr. Weyerhaeuser's first sawmilling experience began. He accepted the job as night fireman in the sawmill of Mead, Smith & March. Eventually by dint of close application, thrift and economy he, with his brother-in-law, obtained control of a small sawmill in Rock Island during the early sixties, he having been married previously in

1857 to Elizabeth Bloedel, who had come from his home town. Mrs. Weverhaeuser died two years ago.

The thrift and economy which Mr. Weverhaeuser had exercised in the beginning continued and with it his financial strength continued to grow. He concentrated his efforts on the salvage of logs, thousands of which were allowed by other concerns to escape in the drives to mills. Along the same lines he eventually thought out the plan of forming the Mississippi River Boom & Logging Company in order to cut out the profits of cutters, drivers, steamboat men and others before the logs reached the mills. This organization, which was a combination of the biggest men in the lumber business in the Middle West, was eventually consummated at the Briggs House in Chicago in 1870, Mr. Weyerbaeuser eventually becoming president, which position he held for forty years.

His accumulation of timber, from which he has made his greatest wealth rather than from actual sawmill operations, continued steadily and eventually in 1894 he gained the co-opeartion of Edward Hines, also an exceedingly successful lumberman of Chicago, which resulted in future important developments. His first large holdings were in the white pine lands of Michigan, Wisconsin and Minnesota, but in later years he entered the Pacific coast field and also gained vast interests in southern pine operations. In fact, so tremendous were his dealings that organizations of from \$12,000,000 to \$15,000,000 were considered as comparatively small.

Mr. Weyerhaeuser's wealth was estimated at from \$1,000,000,000 to-\$1,500,000,000, and it will be difficult to arrive at an actual estimate till such time as a careful appraisal has been made.

His four sons continue in business which their father founded and all have gained their knowledge by passing through a training school of experience.

Mr. Weverhaeuser lived unpretentiously in a comfortable mansion in St. Paul and never made any special pretenses. He will be mourned by his many friends in and out of the lumber business who recognized in his quiet, simple but blameless life a sterling character.

Old Dominion Veneer Company

HARDWOOD RECORD is advised that the Old Dominion Veneer Company. of North Emperia, Va., is fully organized with \$70,000 capital stock. The officers are: W. S. Goodyn, president: Harry Schwartz, secretary and treasurer, and Burdis Anderson, vice-president and general manager,

Messrs, Goodwyn and Schwartz are the leading citizens and capitalists of North Emperia and vicinity, and are at the head of the largest bank and of the hydro-electric plant, large box factories and other interests.

The vice-president and general manager, Burdis Anderson, has too long been identified with the veneer business to need any further introduction.

The new concern has acquired all the property and rights of the Schwartz & Willard Company, which had operated a two-machine rotary mill at North Emporia for two years. The mill has been completely remodeled, doubling the log boiling and veneer cutting facilities and has installed electric power with individual motor drives throughout. This will greatly increase the capacity and efficiency of the mill.

The company owns upwards of 25,000,000 feet of timber, largely suitable for veneers, and will buy both standing timber and logs.

The plant is further fitted with a large Philadelphia textile dryer, an electric hoist and derrick in the yard, and every modern appliance, sothat it stands as one of the best equipped mills in that part of the country, and is as well prepared as any to produce rotary cut veneers promptly and economically.

RETARY OF THE LUMBER MUTUAL CASUALTY INSURANCE COMPANY

LOUIS H. PARKER, NEW YORK CITY, SEC- FREDERICK WEYERHAEUSER, ST. PAUL, MINN., BORN NOVEMBER 21, 1834-DIED APRIL 4, 1914

BURDIS ANDERSON, VICE-PRESIDENT AND GENERAL MANAGER OLD DOMINION VENEER COMPANY, NORTH EMPORIA, VA.

W. B. Morgan Moves to Pine Bluff

W. B. Morgan, secretary of the Anderson Tully Company until a few days ago, has gone to Pine Bluff, Ark., to take charge of the affairs of the Morgan Veneer Company which was recently incorporated with a capital stock of \$100,000 and which is erecting a plant at that point for the manufacture of rotary veneers from gum lumber. Mr. Morgan's resignation became effective April 1 and he is now at Pine Bluff. Much pleasure is expressed among his friends over the fact that, while Mr. Morgan has accepted the presidency and general management of the new company, he will retain his stock in the Anderson-Tully Company and will likewise remain a director in that corporation. It is more than probable too, that he will retain his position as a member of the governing board of the Southern Hardwood fitallic Association, as a manber of the directors of that body reside outside of Memphis. Mr. Morgan's family will remain in Memphis for a time and then join him at Pine Bluff where they will make their future home. Mr. Morgan, in leaving Memphis, carries with him the good wishes of an unusually large circle of friends who have recognized his business ability and who are predicting for him a brilliant career in his new field.

Broom Handle Factory to Operate

It is announced from South Pittsburg, Tenn., that the broom handle factory recently started by the H. T. Haskew Lumber Company of that city will soon be in operation. The machinery is pretty well installed and a considerable number of new hands will be taken on. It is expected that there is sufficient broom handle timber in the immediate neighborhood of South Pittsburg to make possible the operation of a mill for an indefinite period.

Furniture Factory Damaged by Fire

Fire of unknown origin destroyed the dry kiln and stock room of the Buckstaff-Edwards Furniture Company at Oshkosh, Wis., on Monday. March 30. Considerable damage was done to mahogany and hardwood stocks and the flames threatened the main buildings. Work in the factories was interrupted for only one day. The loss was fully covered by insurance.

The Stimson Veneer and Lumber Company

The Stimson Veneer and Lumber Company which recently filed articles of incorporation at Memphis, with a capital stock of \$100,000, as announced in HARDWOOD RECORD, will be perfected as soon as the charter has been received. The stockholders in this corporation are practically identical with those in the J. V. Stimson Hardwood Company and it is known that J. V. Stimson will head the new firm which has been organized for the specific purpose of operating the hardwood mill and veneer plant recently purchased from the Willey interests in Chicago. This machinery is located in North Memphis and has been idle for some years. It was recently purchased by J. V. Stimson and associates. The sawmill has already been placed in operation but it is cutting for the J. V. Stimson Hardwood Company at present and will continue to do so until the new company has secured a sufficient log supply of its own. The veneer machinery has not yet been started but it will be placed in operation shortly in the interest of the Stimson Veneer & Lumber Company. R. V. Stimson, who recently came to Memphis from Chicago, will be in charge of operations at the Willey plant. Much pleasure is expressed in hardwood circles here over the developments which have resulted in the reopening of the band mill and veneer machinery, as the plant is one of the largest and most complete in this part of the country. The incorporators of the new firm are B. F. Katterhenry, J. V. Stimson, R. V. Stimson, A. M. Horton and D. L. Katterhenry.

An Important Machinery Transaction

One of the most important machinery transactions for some time was the recent purchase of the Hanna-Brackenridge Company, Fort Wayne, Ind., by the Wayne Machinery Company of that place. The officers and directors of the new firm are: George H. Van Arnam, Nathan Rothschild, W. L. Fridall, A. N. Cruser, J. E. Elliott, sales manager, and J. E. Monahan, factory manager.

The business is to be carried on as a general machinery merchandizing proposition, and the experience of the men in charge, together with the personnel of the board of directors should merit the consideration and confidence of the trade.

The business of the Hanna-Brackenridge Company was organized some fifteen years ago, and this concern was widely known as a dealer in and rebuilder of second-hand machinery.

The stock taken over by the new company consists of between 600 and 700 machines, including sawmill, planing mill, box, furniture, hoop, stave, heading, wheel, wagon, sash, blind, engine, electrical and various other kinds of machinery equipment, together with boilers, tools, etc.

This stock is to be largely reduced and the determination of the Wayne Machinery Company is that each machine shall conform strictly to representation.

New Russe & Burgess Mill Burned

The big new band mill of Russe & Burgess, Inc., which was built last year to replace the old plant, was entirely destroyed by fire which originated in the engine room early Sunday morning. The loss is estimated at \$50,000, fully covered by insurance. The plant was located outside of the city limits and a long line of hose had to be stretched in order to enable the firemen to fight the blaze. They succeeded, however, in confining the flames to the mill proper, thus preventing a spread thereof to the lumber owned by that firm as well as by other firms having mills and yards in the North Memphis lumber district.

Two representatives of the company from which the firm bought the new machinery last year have already arrived in Memphis, in response to telegraphic requests from the members of Russe & Burgess, Inc., which is only another way of saying that immediate steps will be taken looking to the rebuilding of the mill. Specifications are now being prepared and the order will be placed with as little delay as possible. In the meantime, the firm has made arrangements with the I. M. Darnell & Sons Company and the Gayoso Lumber Company to do its sawing for it, so that the fire will interfere very little with its business.

This is the fifth lumber fire within the past year and, by a rather striking coincidence, practically all of them have occurred on Sunday morning. No importance, however, is attached to this latter fact.

Starts Veneer Plant in Arkansas

The Purdy Cooper Chair Company plant at Malvern, Ark., has been leased by H. A. and R. E. Van Deasen, late of Cotton Plant, who will convert it into a factory for the manufacture of drawer bottoms, tanks, cross-banding, center and face stock. These gentlemen who have had twenty-five years' experience in their lines intend to begin work imme-

diately, and will install new machinery and overhaul old machinery, beginning operations within a couple of months. The plant will employ from twenty-five to fifty men.

Fire Started by Tramps

Tramps built a fire on the wooden floor of a vacant factory building in the Greenpoint section of Brooklyn, N. Y., recently, and as a result a \$300,000 damage resulted. The flames spread rapidly from the vacant building to a large four-story factory of the Standard Wood Turning Company, and before they were checked one side of the building, which occupied half a block, was burned.

New Kentucky Veneer Plant

There has been a new band sawmill erected at Jackson, Ky., by S. E. Patton, manufacturer of hardwood lumber, veneers and other wood products of Jackson. Mr. Patton purposes further to erect a veneer plant within a short time. He will manufacture sliced and rotary cut veneers in walnut, poplar, oak, basswood and hard maple.

Fire Causes Damage in Furniture Warehouse

Fire destroyed part of a warehouse used by the Boutell Furniture Company at St. Paul, Minn., on the night of March 29. The damage to merchandise is estimated at \$50,000. The fire started on the second floor. Much of the damage was caused by water.

A Correction

The last issue of HARDWOOD RECORD contained, under Chicago news, a statement based on some misinformation to the effect that the Williamson-Kuny Mill & Lumber Company, Mound City, Ill., had sold out to P. T. Langan, Cairo, Ill. This statement as received at this office specified that development exactly, but it was an error, as the Williamson-Kuny Mill & Lumber Company has simply sold out its retail lumber stock such as sash, doors, blinds and builders' hardware, which is maintained at Cairo, Ill., and which represented only five per cent of the total assets of the company. The sale had nothing to do with the sawmill business, wholesale lumber business, veneer business or dimension stock business, all of which have grown to such an extent that the company has decided to give its whole time and attention to that end, and go out of the retail lumber business altogether. The latter has been one of the branches for the last ten years.

Large Timber Tract Sold

It is announced that the Vredenburgh Sawmill Company of Vredenburgh, Ala., has purchased of P. B. Ray of Salco, Ala., 16,000 acres of timber land in Monroe county, that state. The consideration is not stated. The land, which is known as the Hunter-Benn tract, is heavily timbered, and it is the intention of the sawmill company to cut all timber and afterward sell the land in small tracts. The land is said to be suitable for agricultural purposes.

The timber from the land will be hauled to the mill at Vredenburgh over the tracks of the new Gulf, Florida & Alabama railroad, which is building through the tract at the present time. The tract of land is about forty miles from Vredenburgh and in two months the railroad will reach Vredenburgh.

Mrs. Anna H. Coppock

Mrs. Anna H. Coppock, wife of Samuel P. Coppock, Fort Wayne, Ind., died at noon, Tuesday, March 17, at her home, 901 West Wayne street. She had been in poor health for several months, but her condition seemed to be improving until she was suddenly attacked with heart failure and passed away in a few minutes.

Mrs. Coppock was born at Taylorsville, Pa., July 3, 1849, and was brought to Ohio when small by her parents who traveled in a covered wagon. They took up residence in the neighborhood of Alliance, O., until the early '90s, and then moved to Portsmouth, O. From there they traveled to Fort Wayne, in 1899. Mrs. Coppock was held in high esteem by all who knew her, and was especially esteemed for her love, good cheer and devotion to her family and friends, and her never ceasing kindliness and optimism.

The surviving family consists of the husband, S. P. Coppock, and the following sons and daughters: Mrs. J. W. Taylor, Columbus, O.; Mrs. W. P. Lowry, Portsmouth, O.; Willis H. Coppock, Orleans, Ind.; Orroll U. Coppock, Memphis, Tenn.; Thomas B. Coppock, and the Misses Sue and Agnes Coppock of Fort Wayne, and a sister, Mrs. Will Coultes, and brother, Edward Buckman, of Topeka, Kan.

S. P. Coppock and his three sons are associated together in the firm of S. P. Coppock & Sons, Fort Wayne.

Mrs. George O. Worland

HARDWOOD RECORD received with deep regret notice of the death of Mrs. George O. Worland, wife of George O. Worland, assistant manager of the Evansville Veneer Company of Evansville, Ind., and present secretary of the Evansville Lumbermen's Club. Mrs. Worland has suffered patiently for several years with complications and died at Evansville from paralysis. She was buried Saturday morning, March 22. The services were conducted by the Rev. Father Ryves and the interment was at Oak Hill Cemetery. Bedna Young, Daniel A. Wertz, J. C. Greer, Charles W. Talge, Mr. Raymond and John C. Keller acted as pallbearers.

Mrs. Worland was thirty-eight years old at the time of her death. She came from a prominent family of Richmond, Ky., and was a woman who had many friends.

Elmer E Barnahy

Charles H. Barnalo, president of the National Hardwood Lumber As sociation and proprietor of a business run by bunselt at Greencastle, Ind., lost his brother, Elmer E. Barnaby, of Nashville, Tenn., who died at Nashville on March 30 after a long Illness. Mr. Barnaby had suffered for some time with kidney trouble.

The deceased was formerly in partnership with his brother, they operating as Barnaby Brothers at Greeneastle. III health eventually compelled him to retire from active business.

He was born at Alliance, O., on February 14, 1862. His operation with his brother was terminated in 1898

New Blue Book Out

The National Lumber Manufacturers' Credit Corporation, St. Louis, Mo., announces that the new April, 1914, edition of the Blue Book has just been sent out, and that it contains a world of new information, the book being considerably larger than any before published

Pertinent Information

Kitchen Cabinets in Swiss Homes

A report by Philip Holland, at Basel, Switzerland, says that in that country a home is incomplete without a kitchen cabinet or a like piece of furniture in the kitchen. As German is the language of the northern Swiss, the German habits and customs prevail. These people are most thrifty and systematic and have a place for everything and everything in its place. Almost every home is provided with an article of furniture in the kitchen which serves as a receptacle for the various culinary articles and supplies.

Selling prices in Basel range from \$14 to \$56, according to size and finish, some expensive cabinets being elaborately ornamental. Those on display in furniture stores here are of local make. Sometimes they are specially designed to fit into given spaces in the kitchens. The Swiss artisan is adept in constructing such articles of furniture as require careful detail work.

The consul thinks it is likely that a market can be found in Basel for the American-made kitchen cabinet if it can be proved to the public that the article is equal to or superior to those in the local market and can be sold for the same or lower price. Granting that this can be done, the question arises of getting the article before the public. To do this, the dealer must first be convinced that the article is salable.

It is suggested that firms seeking to enter that market send a representative who speaks German to introduce the goods.

Largest Cross-Cut Saw Ever Made

There has just been delivered to Rodney Burns Redwood Novelty Company of Eureka, Cal., the largest cross-cut saw that has ever been made so far as is known. This is twenty-two feet three inches long and is furnished with Redwood King pattern of teeth, which are exceedingly long and are particularly adapted to sawing a high class of timber. The saw was made on special order for felling and cross-cutting a redwood tree twenty feet in diameter. Logs thirty feet long will be cut from this and shipped in sections to San Francisco. These sections formed into a log and stump hut will be on exhibition at the Panama Exposition at San Francisco in 1915.

On account of the excessively large diameter of the tree it was necessary to order a special saw which would admit of the cutting of logs without the use of an ax. There is shown herewith a photograph of the saw, which was made by E. C. Atkins & Co., of Indianapolis, Ind., from which photograph some conception of its size can be formed.

The use of this saw will necessitate the employment of two men on either end. Saw will be exhibited in connection with the logs at the exposition.

THE LARGEST CROSS.CUT SAW EVER MADE TWENTY-TWO FEET THREE INCHES LONG.

THE GLUE THAT IS APPLIED COLD -

In Flush Veneered Doors

The chief consideration is uniformly highgrade glue. Manufacturers of this modern type of door realize that its development has been retarded because the unavoidable lack of uniformity in other types of glue makes it impossible to know how long a door will stay in condition. The

Of vegetable glue insures absolute uniformity because of the very nature of preparing it and because every pound of our raw material is rigidly inspected.

Vegetable Glue

Is also a rigid and permanent adherent; will not blister in sanding; has no disagreeable odor; will not deteriorate in standing-for a week if necessary; and can be applied cold without any heating application of any kind in the glue room. In addition, the average saving over former glue bills has been twenty per cent where vegetable glue is used.

A DOOR MAKER SAYS:

Tacoma, Washington, U. S. A., Sept. 29, 1918.

Perkins Glue Company,
South Bend, Indiana.

Gentlemen: The convenience and economy of the use of Perkins vegetable glue, its uniformity and the satisfactory results we have obtained, together with the courtesy we have been uniformly shown by the officers and representatives of the company, prompt us to express in this way our appreciation of the Perkins Glue Company and its products.

Yours very truly,
THE WHEELEK, OSGOOD COMPANY,
R. H. Clarke, Treasurer.

Perkins Glue Company

THE GLUE THAT RUNS ABSOLUTELY UNIFORM

An Opportunity for Foreign Investment

A recent consular and trade report issued by the Bureau of Foreign and Domestic Commerce, department of commerce, Washington, D. C., contains a notice of an opportunity for foreign investment in timber under heading No. 12751, timber concessions.

The report from an American consular officer states that a resident of his district has furnished details regarding certain timber concessions which he claims he is in a position to obtain. The timber includes cedar, fir, larch, oak, ash, birch and walnut. This person states that he will be willing to offer his assistance for the organization of a company to exploit the forests. He desires to hear from American capitalists interested in this proposition.

Joint Rates Suspended

Freight tariffs published March 1 which were to cancel joint rates made between the trunk line railroads and industrial lines in all parts of the country, have been suspended by the Interstate Commerce Commission until July 30. The action was taken following the filing of protests against the proposed cancellation by several industrial lines, including two in the Chicago district. Several trade organizations also protested. The contention on the part of the trade organizations was that the cancellation of joint rates would increase the sum charged shippers for handling freight. This increase would come under the charges made by the switching lines of the roads along which the factories are located.

It seems that the suspension is not effective against certain industrial railroads which have figured in investigations effecting the iron and steel industries. Both of these roads are operating in the Chicago district and do not come under the order, and the cancellation of the joint rates is, so far as they are concerned, now in effect.

Western Woods for Telephone Poles

The Forest Products Laboratory at Madison, Wis., has completed a series of tests undertaken for the purpose of determining the suitability of certain western timbers for telephone poles. The experiments were made by Norman de W. Betts and A. L. Heim. The result has been wholly satisfactory and shows that with preservative treatment enormous resources of poles may be made available on the western mountains.

The rapid extension of telephone and power lines in the West makes the question of pole supply one of increasing importance. Tests show that both green and fire-killed todgepole pine and fire-killed Engelmann spruce will, under certain conditions, make suitable pole timbers. Western red cedar has long been the standard pole timber in the western states. It has held its place mainly on account of its durability in contact with the soil, though its light weight has also been a very desirable feature. The tree (Thuja plicata) grows principally in Washington, Oregon, and northern Idaho. In addition to its wide use for poles, it is extensively cut for lumber, and especially for shingles. In the states south of its region of growth the cost of cedar is high, owing to the great distances over which it must be transported. Moreover, the heavy drain on the available supply must soon result in higher stumpage prices. There are at present in both the Rocky Mountain and coast ranges abundant stands of lodgepole pine (Pinus contorta), often called by local lumbermen "white pine," of little value for lumber, but well adapted for poles. Lodgepole pine is not naturally durable in contact with the ground, and for that reason has not been able to enter the field as a competitor of western red cedar. The general adoption of preservative treatments by railroad and telephone companies, however, has changed the situation. At an additional cost for treatment that still leaves the pine pole the cheaper of the two in most of the markets outside the region where cedar grows, the pine may be made to last longer than untreated cedar. Lodgepole pine takes treatment readily. Cedar, on the other hand, allows but a very shallow penetration.

Another tree, Engelmann spruce (Picea engelmanni) also has a wide distribution throughout the Rocky Mountains, although it grows commercially only at the higher altitudes. It is thus not so available as the lodgepole pine, nor in shape or in its ability to take preservative treatment is it so well adapted for poles. It grows farther south, however, and in many districts is the only native timber available for pole use. The relatively restricted range of western red cedar indicates the importance to the more southern mountain states of determining the value of local timbers for telephone and power line poles.

Forest fires in the Rocky Mountains have killed many stands of spruce and pine, and the disposal of this material, which, through checking, is rendered practically useless for saw timber, has always been a troublesome problem. On many areas such material remains entirely sound for a number of years after the fire, and, besides, is thoroughly seasoned and thus ready for treatment as soon as cut. In some regions the mines use all the available dead timber, though elsewhere there is a great deal of prejudice against the use of fire-killed material, under the mistaken assumption that there is some inherent difference in wood that has been seasoned on the stump and wood that has been cut when green,

The Spring Fire Hazard

The Lumbermen's Underwriting Alliance, Kansas City, Mo., has issued its regular news bulletin for the information of its members. It emphasizes the warning that high winds of spring increase the danger of

There is asserted by without during part of this period, and dangerous tires are liable to start. It is of particular importance that premises be kept clean during this time. Combustible material should be kept out of reach of sparks that may fall in, on, or about the buildings and yards. It is necessary to increase the efficiency of watchmen, because the more promptly a blaze or smoldering spark is discovered, the less is the danger that the fire will spread and get beyond control.

The record shows that, as is usual during the winter season, fire losses have been very light. Cold weather, abundant rain or snow in most sections, and absence of high wind have rendered it comparatively easy to check such blazes as developed without serious damage. That no season is proof against starting of fires is demonstrated by such fires as did Ten were reported by members of the alliance between January OCCUE 9 and Marca 14. The largest loss was that of the Crookston Lumber Company at Bemidji, Minn., \$9,000. All other losses combined did not At a list !

Statement of Ownership and Management

Agreeable to the act of Congress of August 24, 1912, requiring publishers of periodicals to file with the postmaster-general and the postmaster in the office at which such publication is entered, a sworn statement setting forth the names and postoffice addresses of editors and managing editor. publisher, business manager and owners, and in addition the stockholders, if the publication is owned by a corporation, and also the names of known bondholders, mortgages, or other security holders, and that such sworn statement shall be published in such newspaper or other publication, the following statement is herewith printed:

HARDWOOD RECORD is published twice a month at Chicago, Ill.

The names and postoffice addresses of the editors are as follows:

Henry H. Gibson, editor and business manager, 5229 Greenwood avenue, Chicago, Ill.

Hu Maxwell, 927 Asbury avenue, Evanston, Ill., associate editor.

E. W. Meeker, 926 Airdrie place, Chicago, Ill., associate editor.

Publisher: The Hardwood Company, 537 South Dearborn street, Chicago, Ill., the officers of which are Henry H. Gibson, president: E. H. Defebaugh, vice-president: Harry F. Ake, secretary-treasurer.

Stockholders holding one per cent or more of total amount of stock are Henry H. Gibson and E. H. Defebaugh.

There are no known bondholders, mortgages and other security holders holding any bonds, mortgages or other securities of this company. Henry H. Gibson, (Signed)

Editor and Business Manager. Sworn to and subscribed before me this sixteenth day of March, 1914. J. S. Pennington.

Notary Public

My commission expires October 24, 1916.

Hoo-Hoo House at San Francisco

There will be at least one building at the Panama Exposition in the construction of which no imitation of wood will be allowed. It will be the Hoo-Hoo house, which will be the headquarters of that association at San Francisco in 1915. It will be the only forestry building there, or the closest approach to a forestry building. The lumbermen of the Pacific coast and of the Inland Empire will build it, and have already taken steps to raise funds among themselves for that purpose. The assessments will be prorated according to the lumber cut in 1913. The manufacturers of sugar pine, redwood, and California white pine will pay one cent per thousand feet of their annual cut; those who cut Douglas fir, spruce, western hemlock and cedar will pay three-fourths of a cent, and millmen of the Inland Empire will pay half a cent.

The cost of the building and the decoration of the grounds will not be less than \$50,000, and the plan is to complete the work next fall and have everything ready in ample time before the exposition opens. The western lumbermen are making preparations to entertain their brethren from east of the Rocky mountains, as well as from all other quarters of the world.

The building will be of educational value. Pacific coast woods will be used in its construction, and no pains will be spared to give an object lesson that will be remembered. The various woods will be displayed in the best manner to show their use,

Tests of White Oak Barrels

The Forest Products Laboratory at Madison, Wis., recently completed a series of tests of forty-eight white oak barrels. The work was done in cooperation with the Bureau for the Safe Transportation of Dangerous Explosives. The barrels were made by the St. Louis Cooperage Company. The tests included side compression, internal pressure, diagonal compression, and dropping. They were submitted to those tests while filled with water. The purpose was to determine how much they would stand. The results have been published, but as the barrels were not compared with any other class of containers, or with barrels of any other material, the conclusions appeal only to technical men who will figure results applicable

Deck Cargoes to Spain

According to a report from Barcelona, the Spanish government has now been constrained to rescind the law that was to have come into force at the beginning of this year, and according to which deck cargoes on woodladen vessels destined for Spain should not be allowed during the winter months. Spanish importers, as well as foreign exporters and shipowners, took energetic measures to get this law cancelled, on the ground that it was disadvantageous for wood shippers. The Spanish government postponed the carrying through of the law till the beginning of this year, but,

Scientific Management

A text book on the scientific management of business has been published by the System Company, of Chicago and New York. It is of a size that may be carried in the pocket, though it is not a reference book. It shows results in eight factories, each illustrating a method of performing a certain class of work. The purpose is to show the advantages of applying most approved systems in carrying on certain kinds of work. The considered are: Standard Tools; A Planning Room; Inside and Outside Planning Boards; Details of Planning Boards; Stockroom Arrangements; Tool Storage Detail: The Ten-Hour Clock; Speed Boss at Work; Selecting Correct Tools; Machine Order Racks; Tools and Materials Saved from Scraps; Assembly Room Arrangement; Right and Wrong Tool Grinding,

The Timbers of Panama

A report on some of the valuable hardwood timbers of Panama was recently published by the Bureau of Foreign and Domestic Commerce, the material for the report having been compiled by James C. Kellogg, stationed at Colon

The word caeba refers, in common Central American usage, to three kinds of trees: Guarea earba, Carapa gunanensis, and Swietema mahagoni. All three occur in the higher parts of Panama. The first two attain a height of 100 feet or more. Their timber is so similar to Honduras mahogany (Swietenia mahagoni) that it is equally valuable-about \$90 per 1,000 feet. The Guarea caoba will run from 3,000 to 5,000 feet per acre, and the amount new standing in the country is valued at \$180,-000.000

The espave (Anacardium rhinocarpus, family Anacardiacem), often 5 feet thick at the base, grows to a height of 80 to 120 feet, of which 40 feet from the base is clear. Some of the large branches are available for lumber. Some forests average fifteen big trees to the acre. The leaves are large, somewhat heart-shaped, light green, and very abundant. The espave is prized so much by the natives as a shade tree that they usually spare it in clearing for planting. They use the timber, however, for their

Eleven Miles West of Memphis, Tenn. Address Sales Dept., P. O. Box 337, Memphis, Tenn. cano's, many of which last for a generation or more. The wood is of a public one cole, resimbling malogany, for which it is often mistaken, It is close-grained, durable, and uniform in texture, takes a polish, and works readily. There are probably 4,500,000 of these frees in Panama, the tumber is worth 880 per 1,000 rect and the total value is arout 815 commons.

The gnava-an (Treasar chrusantha, family Bignomaccar) is somewhat smaller than most hardwoods, averaging 70 feet high and 2 feet thick and branching 30 feet from the ground. The leaves are small and compound, and the grayish black bark is rough and shaggy, with longitudinal furrows. The inflorest received a mass of magnificent golden blossoms. The wood, hardest and most durable of the timbers of Panama, is akin to the lignum-vitæ (Gualiacum) of the West Indies. It is much heavier than water, and to be ratted must be carried with lighter wood. Railway ties of guayacan have been in use on the Panama railroad for more than fifty years. Since it is so hard that holes had to be broad for the spikes, it might be advisable to work it green for some purposes. The small waste of the industry might be used for shuttle blocks, of which the supply in the United States is fast becoming exhausted. There are probably 1,000,-900 of these trees in Panama, worth about \$40,000,000.

The laurel (Cordia gerascanthus, family Borraginacee), 3 feet in diameter, grows on hillsides to a height of 100 feet. The bark is white. The wood is yellow, hard, fine-grained, durable, and easily worked. It is said to be good for piling. There are probably more than 1,000,000 laurel trees in Panama, with an average yield of 1,000 feet per tree and a total value of 850,000,000.

The Santa Maria or calaba (Calaphallum calaba, family Gutiferæ) is a large evergreen, attaining a height of 100 feet or over with more than 50 feet clear and with a diameter at the base of about 3 feet. The bark is comparatively thin, mottled gray and black, and slightly rough. It peels from the wood readily. The wood is grayish white, as hard and elastic as hickory and also similar to teak. It is durable straight, and closegrained, takes a good polish, and splits longitudinally better than most tropical hardwoods. It was used by the Indians for bows and is employed almost exclusively for palanquin poles. There is probably \$70,000,000 worth of this timber in Panama.

Inquiry for Wood Carvings

The Bureau of Foreign and Domestic Commerce says that an American consular officer in Canada transmits the name of a firm in his district which desires to receive from American manufacturers c.i.f. quotations on veneer woods pressed, imitation wood carvings, and machine-made wood carvings, Quotations should be accompanied by printed or other descriptive matter. Correspondence may be in English, and prices may be quoted in American currency. The name and address of the firm making the inquiry may be obtained from the bureau at Washington, D. C. The number of the inquiry is 12,544, which should be given by those who address the bureau for further information.

this arrangement is bound to be a very accentable one. The distance of the Falls from this city is twenty-two miles, which makes the great pleasure resort very accessible. A number of meetings of the committees have been held and arrangement are gradually being made for the entertainment and reception of visitors, though it is too early yet for announcement of details as to program. From Maj. John S. Noyes, who is a member of the entertainment committee, as well as the dean of Buffalo lumbermen, down to the youngest committeeman, everybody is anticipating a very interesting and profitable convention. The attendance is expected to reach at least 600 and it is hoped that it may exceed that number by a hundred or two.

Robert D. McLean is one of the organizers of the newly-incorporated McLean Mahogany & Cedar Company, which has a capital of \$40,000, and which will handle Cuban logs. The other directors are Carlton M. Smith and Morris S. Tremaine, well-known lumbermen of this section.

J. B. Wall has been making a trip South for the past two or three weeks, looking over the lumber situation and calling at the mills of the Buffalo Hardwood Lumber Company.

Anthony Miller reports the hardwood trade as a little slow this month, The yard has been selling a fair amount of maple. Poplar is reported to be off some in price.

Miller, Sturm & Miller have no complaint to make concerning business this month, as trade has picked up considerably within the past two weeks, largely in maple and oak,

Manager H. L. Abbott of the Atlantic Lumber Company, will remove his office on May 1 to the Scatcherd & Son yard, where he has now about 5,000,000 feet of hardwoods.

The Hugh McLean Lumber Company has been getting in a large amount of stock at St. Bernard, near Cincinnati, and the company's hardwood supply there is about three-fourths as large as the Buffalo

C. C. Slaght is preparing to start up his sawmill at Genesee, Pa., early this month and at Coudersport a little later on. He has considerable

T. Sullivan & Co. have bad a fair trade in brown ash, as well as maple, during the past few weeks. The yard has received a large block of white oak in one-inch stock.

The Yeager Lumber Company, Inc., states that the demand for hardwoods has not improved very much so far this month, though the yard has been moving oak, ash and poplar in pretty good quantity.

----≺ PHILADELPHIA ≻=

E. M. Bechtel, sales manager for William Whitmer and Sons, Inc., reports a liberal number of inquiries resulting in good orders. In some lines trading is still sluggish but the average business has been good. Hardwoods especially keep in good shape.

Frederick S. Underhill of Wistar, Underhill & Nixon, does not complain of greatly relaxed trading. Some lines are fairly active, others a little slow, but the total averages up very well. He does not see any obstacle to a near substantial livening up of business. R. Wyatt Wistar is on a tour of the southern lumber fields.

Daniel B. Curll of the D. B. Curll Lumber Company, reports satisfactory trading. The portable mills are busy getting out stuff, and so far the company has been able to keep its stock from accumulating.

A. J. Levy of the Forest Lumber Company, says inquiries have been He has no multiplying of late, with business outlook encouraging. doubt but increased buying will follow seasonable weather. F. X. Diebold, president, is on a visit to the mill at Konnarock, Va. On his return he will make a tour of some of the mill districts for information on the stock situation.

G. C. Burkholder of the J. W. Turnbull Lumber Company, states that J. W. Turnbull is visiting the mills of the Rockcastle Lumber Company, Inc., and C. L. Ritter Lumber Company, Inc., in Huntington, W. Va., Doran, Va., and Offutt, Ky., with whom the Turnbull Company has made a contract recently to handle its stock in New York state. New Jersey, eastern Pennsylvania and the Cumberland valley. By this contract it will be in a position to place in the field some of the best hardwood lumber ever marketed.

John W. Floyd of the Floyd Lumber Company, is certainly immune from the least taint of pessimism. He says things are coming around all right and prices are well maintained. He is confident business will brighten up generally as the weather settles.

Joseph Beck of Estate of Daniel Buck, has just returned from an extensive trip to the leading southern hardwood mills.

Members of the Lumbermen's Golf Club will play the first game of the season on the links of the Atlantic City Country Club, Northfield, near Atlantic City, N. J., on April 16. Competition for the "president's prize," will begin at this meeting and continue at each meeting throughout the season.

George M. Spiegle of George M. Spiegle & Co., says business is a little off, due to bad weather, but the outlook for spring is encouraging.

Schofield Brothers closed their fiscal year March 31, and Frank E. Schofield of this house says they have every reason to be pleased over the year's business.

The A. J. Miller Lumber Company, Roosevelt, N. J., was chartered under New Jersey laws March 23 with a capitalization of \$100,000.

The Central Larrowr Company, West Hosoker, N. J., was incorporated under New Jersey laws, March 27 with a capital stock of \$125,000,

Charles Becker, a retired cabinet maker, this city, died March 28. He was sixty eacht years old.

=< PITTSBURGH **>**=

I. F. Balsley, one of the best known hardwood men in this section, is now manager of the Philadelphia, office of the Craig County Lunder Cor. poration. This concern manufactures large quantities of oak, chestnut and poplar and other hardwoods at Waiteville, W. Va., and Mr. Balsley Is likely to make a big success of these stocks in the eastern market,

The Pittsburgh Wholesale Lumber Dealers' Association recently elected O. H. Babcock, of the Babcock Lumber Company, president: J. C. Donges, of the J. C. Donges Lumber Company, vice president; John G. Criste, of the Interior Lumber Company, secretary and treasurer.

The plant of the Fort Pitt Box Company, in Etna, a north side suburb, was burned April 2 with a loss of about \$100,000. The plant had been very busy the past few months.

The Dailey & Allen Lumber Company is getting a fine line up on hardwood stocks at its new office in the Farmers' Bank building and is making fine headway in its trade. Fred Dailey of this company recently returned from a long trip in the South.

C. E. Breitwieser & Co., have taken on the agency for the oak and hardwood stocks of the Virginia Lumber Company, manufactured at Boyer, W. Va., on the C. & O. Railread, at the rate of 100,000 feet a day.

The West Virginia Lumber Company is moving from the House building, where it has been located for thirteen years, to the Conestoga building, at Wood and Water streets. It will have the entire Water street front of this building on the second floor.

The Joseph W. Cottrell Lumber Company is now located in fine quarters in the First National Bank building, where it moved from the Ferguson building, in Third avenue.

W. D. Johnston, president of the American Lumber & Manufacturing Company, has returned from a trip to Panama and the Bermudas. made some nice sales in lumber while on his pleasure trip.

The Allegheny Lumber Company has been breaking all records so far It regards the prospects as fair, although there is quite a slump in the market at present, and collections are bad.

The Acorn Lumber Company is doing a splendid hardwood business. Its eastern trade has been developing very rapidly of late and the concern is prosperous in all ways.

The Kendall Lumber Company is operating its force in full and has no special fears about the situation. President J. L. Kendall spent a few weeks with his family at St. Augustine, Florida, lately.

-----≺ BOSTON ≻=

The firm of Abbott & Cleaves of Portland, Me., has been incorporated in that city under the style of the Abbott & Cleaves Company, with authorized capital of \$75,000.

Walter G. Jenness, who has for many years conducted a lumber business in Somerville, Mass., and more recently in Brookline, Mass., on March 26 filed a voluntary petition in bankruptcy. The liabilities are reported as \$32,252, and assets of \$3,806.

The Guernsey-Westbrook Company of Hartford, Conn., announces that on March 20, H. E. Pearsall of Providence, R. I., has been elected vicepresident of the corporation. Mr. Pearsall has been identified with this firm for some years, principally in the conduct of the company's hardwood business through New York and New England.

The lumber trade of Boston welcomes back into the active ranks a former prominent wholesaler, A. Wendell Hayford, who after having withdrawn from the lumber business when the firm of Hayford & Chase was succeeded by the Irving N. Chase Lumber Company, has recently incorporated the firm of A. W. Hayford Company, with a suite of offices at 60 Congress street. Mr. Hayford has spent some time the past winter on the Pacific coast although he will not confine his business to western woods, but expects to do a general lumber business.

=≺ BALTIMORE **>**=

There appears to be no reason to complain of the lumber business locally in so far as volume is concerned, if the amounts involved in the building permits issued are an indication. The report for March is now available, and shows that the value of the new buildings, for which permits were issued, amounted to \$679,767.23, with \$86,000 more for alterations and \$64,000 for additions. Included in the aggregate were 124 two-story brick dwellings, 15 two-story frame dwellings, 3 garages, 2 stores, 2 hospitals, 1 apartment house, 1 church, alterations to the Polytechnic Institute and 5 factories and warehouses. Among the structures being planned, but not yet in hand, are a ten-story hotel, a twelve-story office building, a \$225,000 theatre, a new burlesque theatre. and an extension for a third playhouse. In addition, many smaller projects have been waiting for settled weather, and there is every prospect that numerous other undertakings not yet in shape will be brought out before long. For the past three months the value of structures for

M. S. Baer of Richard P. Baer & Co., who returned some ten days ago from Columbus. O., and other points in middle western territory, states that Le Lid an unexpectedly successful trip and the results of his efforts in the section far surpassed his anticipation. He went out chiefly to see whether the business, which had shown a decided listlessness, could not be stirred up somewhat, and he found that it could. Getting in touch with old customers and looking up new ones, Mr. Baer had a very successful round up, both with respect to volume and prices.

Reports of a similar character are made by other Baltimore hardwood men. Frank A. Parker of Mann & Parker, Inc., who has been covering Pennsylvania and adjacent states for two months, says that he has found the yards and other buyers far more receptive than he had supposed, and the results of his travels have been very satisfactory.

The Pagby Furniture Company has asked for bids on its new building to be erected on Eastern avenue and Exeter street. The structure is to be six stories, of brick and steel, and will cover an area 70 by 100 feet. The company has been enjoying a very good business and has found it necessary to provide larger quarters.

Anthony S. Davis, a retired lumber merchant, who for years conducted business at Port Deposit, Md., died at the home of his daughter, Mrs. Alfred Cookman Leach, in this city, on March 26, of a complication of diseases. Mr. Davis had been brought to Baltimore to undergo treatment at a hospital, but there it was realized that nothing could be done for him, and he was taken to the home of his daughter. Mr. Davis was sixty-five years old and leaves a widow, a son and three daughters.

The barrel factory department of the Standard Oil Company at Parkersburg, W. Va., was destroyed by fire on the night of March 25, the loss caused being estimated at not less than \$30,000.

Among the visting lumbermen here during the last two weeks were J. M. Bernhardt, president of the Giant Lumber Company, Lenoir, N. C., and F. X. Diebold of the Forest Lumber Company, Pittsburgh, Diebold was on one of his regular trips, and reported decided quiet, but this was prior to the advent of more favorable weather.

G. L. Wood, general manager of the R. E. Wood Lumber Company, Continental building, started last Thursday on a tour of the company's mills in West Virginia, Tennessee, and North Carolina, and expects to be away for several weeks, getting in touch with details at the various plants and otherwise posting himself concerning what has been done of late.

Joseph Farnan, who has been connected with the J. S. Hoskins Lumber Company for years, and was for a time harbor master, holding also other public positions, died on March 28. He was widely known in the lumber trade, not only because of his direct connection with it, but also in consequence of his position as harbor master. He had a large circle of acquaintances and was held in warm esteem. He is survived by his wife, a daughter and three sons.

----≺ COLUMBUS >-

The Valley Tic and Lumber Company of Staunton, Va., has moved its branch from Logan to Columbus, and offices have been located in the Columbus Savings and Trust building. The Columbus branch is in charge of George T. Graham. Branches are also located at Roanoke, Va., Lexington, N. C., and Johnson City, Tenn.

The Handy Wood Worker Company of Cleveland has been incorporated with a capital of \$10,000 to manufacture wood working machinery by II. H. Johnson, M. V. Stainsbury, M. L. Locher, F. I. Cannon and O. L. Lampus.

Plans have been prepared for the enlargement of the plant of the Standard Box Company of Sandusky, Ohio. The work of making the improvements will start at once.

R. W. Horton, sales manager for the central division for the W. M. Ritter Lumber Company, says trade is fairly good for the time of the year and the rather unfavorable weather. The demand appears to be spotty. There is good business in all hardwoods one day and the next is very quiet. Prices are somewhat unsteady but are being pretty well maintained at the levels which have prevailed for some time.

J. W. Maybew of the W. M. Ritter Lumber Company, who has been seriously ill for several months, is again able to be at his desk,

John R. Gobey of the concern bearing his name reports a fairly good demand for hardwoods with prices generally well maintained. He believes more activity will develop in the future.

Plans have been made for the rebuilding of the plant of the Defiance Box Company of Defiance, Ohio, which was destroyed by fire recently. At Canal Dover, Ohio, the Garber-Marsh Lumber Company recently started business.

C. A. Ervin has been elected president of the Ervin-Finley Mill and Lumber Company of Hamilton, recently chartered with a capital of \$25,000. I. S. Finley was elected vice-president and S. D. Mayer, secretary-treasurer.

The Hixon Lumber Company of Toledo, which operates six branch yards

----≺ INDIANAPOLIS >-----

The Charter Oak Handle and Luctor Company, Richmond, has voluntarily dissolved its corporation.

To Wilham P. Johnson Lu, our Company has taken out a formit to robuild its planting mill, which was burned recently at a loss of \$35,000. David R. Webb, owner and operator of the Muloda veneer plant at Edinburg since 1906, died at bis home in that place March 30, after a short illness. He was sixty years old and is survived by his widow and two daughters. Mrs. Chande Mail you Evensythic and Mrs. Percy Brodeck of Edinburg.

Thomas A. Fletcher of this city has acquired 4.120 acres of timberland near Yazoo, Miss., from Peter P. Sturgeon of Nisland, S. D., and Grant A. Dentier of Tacoma, Wash - Mr Fletcher traded Indianapolis properties and farms in Indiana and Illinois.

Samuel L. Winternitz and Company, auctioneers, Chicago, have bought at auction the bankrupt property of the American Motors Company, through Frank E. Smith, receiver, for \$110,000. The plant will be dismantled and sold piecement. This was one of the older motor car plants in the city, but the company was unable to withstand the financial depression that began in the automobile industry last summer.

-----≺ MEMPHIS ≻=

The Price-Ruhl Lumber Company, whose incorporation was published in Hardwood Record some months ago, has completed its plant at Dyersburg, Tenn., for the manufacture of lumber. It will be placed in operation in a short while.

R. J. Darnell, Inc., has removed its offices from the Exchange building to the fourteenth floor of the new half of the Bank of Commerce & Trust Company building on Main street. Several rooms have been taken, the suite being one of the most extensive occupied by any single lumber firm in Memphus. Several other hardwood firms have leased offices in the building in question and will occupy these as rapidly as they are completed and placed in readiness for them. The Southern Hardwood Traffic Bureau has likewise given up its offices in the Exchange building and has taken more commodious quarters adjoining those of R. J. Darnell, Inc. The Gum Lumber Manufacturers' Association has an attractive suite in that building also and lindications are that there will be a decided sprinkling of lumber firms and lumber organizations in that building.

Announcement is made that F. T. Turner, for a number of years in charge of logging operations for Russe & Burgess, Inc., has been appointed manager of the two mills of the Darnell-Love Lumber Company at Leland, Miss. He has had wide experience in logging work and his duties along this line, according to his friends, have admirably fitted him for the promotion he has received. The Darnell-Love Lumber Company is closely allied with R. J. Darnell, Inc., with an extensive hardwood plant only recently placed in operation at Batesville, Miss. R. J. Darnell is head of both firms.

The Four States Land & Timber Company has recently been incorporated here, with a capital stock of \$50,000. It is the purpose of the new firm to attract northern capital for the development of timber and cut-over lands in Mississippi, Alabama, Arkansas and Tennessee, the four states from which it takes its name. E. R. Parham, a well known real estate man here, is head of the new company.

The W. B. Bayless Company has been incorporated here with a capital stock of \$70,000. W. B. Bayless, W. M. Turner, L. M. Thompson, J. M. Patten and S. W. Scott signed the incorporation articles. The company has been formed for the purpose of manufacturing tool handles at its several plants in Arkansas. It will also act as distributing agent in other lines. Its headquarters will be maintained in Memphis.

The anti-shingle ordinance is still being pressed by the insurance men of this city who are seeking to prevent the use of wooden sningles for a house covering within the city limits. It is not likely, however, that they will be successful for the reason that the ordinance is being vigorously opposed by Thomas Dies, commissioner of public utilities. He says that the ordinance in its present form will work a serious hardship on many people and that it is not justified.

George D. Burgess, of Russe & Burgess, Inc., returned recently from a trip to northern and eastern points. He spent some time in Washington conferring with J. R. Waiker, attorney for the Southern Hardwood Traffic Bureau, of which he is chairman. He also held a conference with K. D. McKellar in regard to the bill now pending looking to compulsory issuance of through bills of lading on all commodities. It is designed through this measure to prevent the railroads from discontinuing, on one pretext or the other, the issuance of through bills on lumber and lumber products every once in a while, causing the exporters of lumber agreat deal of loss in time and money and seriously hundleapping them

in the conduct of their business. Mr. Burgess is hopeful of the passage of the bill which has the hearty endorsement of the Southern Hardwood Traffic Burgen.

=≺ NASHVILLE **>**=

The announcement of the death of Henry H. Gibson, editor of Hambonon Recons, was received with Rech sorrow by local members of the trade. Mr. Gibson had many acquaintances among the local hardwood men, by whom he was highly esteemed, and who had wide regard for his eminent knowledge in regard to the hardwood industry in the United States.

Several matters of interest came up at the last weekly meeting of the Mashville Lumbermen's Club. President Henderson Baker was authorized to appoint a man to represent the club with the Nashville Boosters who will make a tour of Alabama, Louisiana, Mississippi and west Tennessee on a special train next month. G. A. Washington of the transportation committee reported that the proposed advance of one to three cents in freight rates on lumber from points in Kentucky to Nashville and beyond had been suspended by the Interstate Commerce Commission until July 30, pending investigation of the equity of the increase. Complaint was made by the Tennessee Oak Flooring Company and Hunt, Washington & Smith of this city against the increase.

The Interstate Commerce Commission has refused to suspend the increase of one to two cents per 100 pounds on the rate on crossites shipped from points in Tennessee and Kentucky, on complaint of the Nashville Tie Company and others. It is claimed that the refusal was due to the failure of the complaint being made ten days before the rate went into effect, though the complainants alleged that they were not notified of the increase until a few days before it became operative. Complainants allege that the increase will do a great damage to a large crossite business developed by them.

McEwen Ransom of the Nashville Hardwood Flooring Company reports a fair demand for flooring, though no unusually large contracts are being made.

R. S. Maddox, new state forester of Tennessee, announces important plans for reclaiming forests in Tennessee, and promises to take all steps that will be permitted by the authority and resources of his department.

M. F. Greene of the Davidson, Hicks & Greene Company has returned from an extended stay at his winter home in Florida.

W. A. Passmore, formerly of McMinnville, Tenn., who has established a lumber business at New Market, Ala., was here, and reported that business is in good shape in his territory, and that his firm is accumulating a good stock of hardwoods.

The purchasing and distributing yards of J. Gibson McIlvain & Co., of Philadelphia, will be closed. Polk C. Curtis, who has managed the local branch, will open retail yards at the same place, and will also handle a wholesale and commission business in hardwoods.

Building activities at Nashville for the month of March showed material increase. The record of the city building department shows permits for improvements to cost \$229,980 last month, compared with \$186,554 the same month last year.

Heavy rains last week gave the highest tide of the season on Cumberland river, and local firms are expecting to receive 6,000,000 or 8,000,000 feet of hardwood timber from the upper river section, which will be floated to market.

Commissioner Meyer of the Interstate Commerce Commission came to Nashville to hear testimony in the reciprocal switching case in which the city is complainant. Several prominent manufacturers in the hardwood lumber line were witnesses. A former terminal employe testified that the cost of switching cars from one line to the other was about 31 cents, whereas a charge of from \$2 to \$30 is made. The trouble is with the Louisville & Nashville Railroad, which refuses to have reciprocal switching relations with the Tennessee Central except on a basis that is practically prohibitive on competitive business.

=< LOUISVILLE >=

Members of the Louisville trade received with deep regret news of the test of Henry H. Gibson, editor and manager of Harnwood Recond, who was personally known and warmly regarded by practically all of the lumbermen here. Appropriate resolutions were adopted by the Louisville Hardwood Club at its meeting March 31.

The Churchill-Milton Lumber Company, which is operating a yard in New Albany, Ind., across the river from Louisville, has taken over the lumber stocks in the New Albany yard of the Edward L. Davis Lumber Company, which is to discontinue operations on that side of the river.

Ned Booker, president of the Booker Box Company, is being congratulated by reason of the advent of a baby boy at his home. The stork arrived March 31. Mrs. Booker and the baby are getting along nicely. The youngster will be called S. E. Booker, Jr., and promises to develop into either a lumberman or box manufacturer.

The Brunswick Creosoting Company is being organized in Louisville with \$150,000 capital stock, and will put in a creosoting plant at Brunswick, Ga. Yellow pine railroad ties will be treated there and shipped by water to the eastern markets. A site has been secured, and work on the plant will begin in the immediate future. Frank S. Cooken, a well-

known retail lumberman of Louisville, is one of those interested. James B. Wilson of the Kentucky & Lishana Terminal Railroad Company is to be the active manager of the enterprise.

J. E. Barton, state forester of Kentucky, has published his first biennial report, covering 104 pages and giving much valuable information regarding the forests of Kentucky. The department was created in 1912, and though an effort was made to abolish it at the recently completed session of the state legislature, it was endorsed and given an adequate appropriation for continuing its work. Arrangements are being made through Mr. Barton's office to have the federal government look over castern Kentucky forest lands with a view to establishing a reserve. The state legislature enacted a law at the 1914 session giving the federal government the right to acquire forest lands, and it is practically certain that this will be done.

The Kentucky legislature has given lumbermen at least one thing to think about, and that is workmen's compensation. The new law has been signed and takes effect June 15, although the system itself does not become operative until January 1, 1915. The system provides that a workman who is hurt is to receive fifty per cent of his wages during the period of disability, with a minimum of \$5 and a maximum of \$12 a week. If he is permanently disabled or killed, he or his dependents are to receive the weekly indemnity for an indefinite period, not to exceed \$3,750, however. The employer may insure with the state, which is to collect premiums at a rate not greater than \$1.25 per \$100 of payroll, or with a stock company, or he may carry his own liability. The insurance companies were opposed to the bill, as it is practically certain to knock them out of business. The rate quoted by the state is much smaller than they will be able to write the business at, and they insist that the state will find its revenues inadequate to pay losses. The coal operators of eastern Kentucky were largely instrumental in putting the law into effect, on account of liability insurance rates being almost prohibitive, and it is said by some that the rate of \$1.25 which will be paid by them will be only about one tenth of what will actually be needed. Some serious complications may develop if the money proves to be inadequate, but the state board is empowered to increase the rates after the first year. The lumbermen are studying the law carefully, so that by the time the system goes into effect they will know where they

The Louisville Hardwood Club has taken action against the use of a spotting charge by the railroads, this being in line with the attitude of the Board of Trade and other local organizations. The lumbermen believe that the charge is unnecessary, and that it would result in the small shipper carrying the load. It is believed, however, that the railroads would prefer not to make a charge for spotting cars for the concern having a switch with a capacity of less than ten or tweive cars.

D. E. Kline, head of the Louisville Veneer Mills, is being urged to run for the presidency of the Louisville Commercial Club, but thus far has declined to allow his name to be used. Mr. Kline is now first vice-president of the club and chairman of its transportation committee. He has served as vice-president of the Louisville Hardwood Club, president of the National Veneer and Panel Manufacturers' Association, and is now vice-president of the Kentucky Manufacturers' and Shippers' Association. His knowledge of association methods and his splendid executive ability would make him an ideal head for the local organization, which is one of the leading business bodies in the country.

→ ≺ ST. LOUIS ≻=

The new Railway Exchange building on Olive street between Sixth and Seventh streets and Olive and Locust is the new home of the Garctson-Greason Lumber Company, formerly in the Times building. It moved in last week. The Gailoway-Pease Company of Poplar Bluff, Mo., opened a St. Louis office in the building a few days ago.

Frank Liebke of the C. F. Liebke Hardwood Mill & Lumber Company returned last week from an extended trip through the East. He sent in some pretty good sized orders. A big shipment of ash logs is on its way up from the South and another big shipment is being loaded.

The Lumbermen's Club will hold its regular monthly dinner and business meeting on April 14. The place of meeting will not be decided on until Wednesday. Judge Spencer will speak on the new city charter. Some important business matters will come up.

The Lumbermen's Exchange of St. Louis mailed out notices to its members last week, calling their attention to its inspection service. It has been making a very satisfactory increase over last year.

The Lumber Dealers' Association of St. Louis has sent out a strong letter to its members calling their attention to the Forest Products Exposition to be held in Chicago from April 30 to May 9. The letter gives the importance of the exposition and urges its members to attend the meeting.

The news of the death of Henry II. Gibson, editor of Hardwood RECORD, was a great shock to the retail and wholesale hardwood lumbermen of St. Louis. He was well liked by those who knew him personally and his articles on bardwood lumber were read with so much pleasure that he was well known to those who never had the pleasure of his acquaintance.

Frank G. Hanley of the F. G. Hanley Cypress Company, who has been on a southern trip, during which he visited many of the cypress mills, says everything seems in pretty good condition for a big spring trade.

O gd c. man at attorneys for the Salme River Railway Company, the Pulaski Chancery Court, on April 2, made permanent the injunction each to the members of the Railroad Commission of Arlemsas, restraining them from enforcing the commission's order requiring the railway company to continue train service between Draughon and New Edinburgh, Ark. A temporary restraining order was granted by the chancery court some months ago, on application of the railway's attorneys, and the same was made permanent on April 2. This road was originally built as a lumber or logging road, and since practically all of the valuable timber along the line has been cut out, the owners no not care to longer operate the road, as they claim it can only be operated at a loss. When they undertook to remove the tracks some months ago, the citizens along the road made protest and secured an injunction from the Jefferson chancery court. The Railroad Commission also issued an order requiring the railway company to operate regular trains over the road, as it had been doing, and to protect themselves against this order the injunction was sought in the Pulaski chancery court. The members of the Railroad Commission of Arkansas state that they propose to fight this case to the

J. M. Dial, who has been running a sawnill at Roon for the past several years, has removed his plant to Sulpiur Springs, Ark., and will cut hardwood timber.

The Chicago Veneer Company is erecting a new plant at Clarendon, the work being done by W. T. McFarlave, of Chicago.

The Dunkle Box & Lumber Company of Black Rock, Ark., was recently sold to the Holland Banking Company of Springfield, Mo. E. T. Irly of Black Rock, is in charge of the plant.

J. F. Light, of Calico Rock, recently bought a large tract of ash and hickory finiherland in the section of country near ison, and will erect an up-to-date sawmill at that place in the near future. Mr. Light is an experienced sawmill man. He proposes to cut timber to be used chiefly in the manufacture of furniture and wagon stock.

The Western Wheelbarrow Manufacturing Company of Fort Smith, recently filed articles of incorporation in the office of the secretary of state. The company is capitalized at \$150,000, and the incorporators are: W. J. Echols, C. E. Spear, Ed Bolman, T. G. Oade and E. F. Dooley.

The Jonesboro Spoke Company, which recently sustained a loss of \$15,000 in the burning of its warehouse at Jonesboro, proposes to rebuild at once.

—⇒ WISCONSIN ≺

The Kneeland-West Lumber Company of Milwaukee has filed articles of incorporation with the secretary of state. The company will maintain its principal office at Philips, Pierce county, and deal in lumber, logs and other timber products. The capital stock is \$700,000 and the incorporators are David M. Kneeland, George A. West and Paul E. Durant.

Articles of incorporation has been filed by the Ashland Veneer Company of Ashland. J. T. Edwards, L. A. Maier and Herman Leicht are the incorporators. The capital stock is \$100,000.

A. A. Fraser, H. C. Fraser and Edward Fraser have *neorporated as the Fraser Lumber Manufacturing Company of Appleton, with a capital stock of \$85,000.

The Naugle Pole and Tie Company, an Illinois corporation with \$100,000 capital and \$25,000 interested in Wisconsin, has filed a statement with the secretary of state to do business in Wisconsin.

The W. H. Pipkorn Company of Milwaukee, dealer in lumber and building supplies, has filed an amendment to its articles of incorporation increasing its capital from \$100,000 to \$125,000.

The White Wagon Works at Sheboygan are being materially enlarged by the addition of a large frame warehouse. 48 by 100 feet in size and two stories high. Plans provide for additional stories and a basement at some future time. The offices and shipping departments of the firm will be removed to the new structure when it is completed, providing additional manufacturing space in the present factory.

The Racine Manufacturing Company at Racine has decided upon the erection of a new brick building, four stories high and 281 by 100 feet in size, to be located on the site of the building destroyed by fire in 1910, at Mead and Eighth streets. This structure will be devoted to the manufacture of the most expensive type of closed automobile bodies and will provide employment to about 250 men.

The large sawmill of the Willow River Lumber Company at Hayward, which has been idle since the Hines company finished its cut in September, 1912, has again resumed operations. Hardwood will be sawed at first and a special train will haul the logs from Grand View to the mill. Over a hundred men are employed.

The Great Northern Pail Company of Gillett, whose plant in that place was destroyed by fire several months ago, is completing the work on its new and modern factory and will soon be running full time.

The Hatten Lumber Company of New London has installed a new engine which was shipped from Manawa and added to the local power equipment. The Menasha Wooden Ware Company has completed temporary arrange-

ments for the manufacture of stay s and heading. Work has been started on both day and hight shifts,

The Pelicin River Lumber C specy will sign, sawing operations about Max 1 at the sawmill locar datwo miles south on the city. The computer will set about two majors of this sesson, it is expected,

The plant and property of the Oracle Handle Company at Rhandlander has seen soft or R. G. Lowell to the Mineral Products Company of Pord di, La. (1) outdling with a used for storage purposes for the present

The Tor. (Lawa, Stay) & Heading to pany has resumed operations at its plant at Tomahawk the first of this month. The factory has been shut down since November 1, when the log supply became exhausted. Since then the plant has been thoroughly overhauled and a large supply of timber delivered to the yards. A. E. Sutilif is manager, George Mecker of Engadine, Mich. is foreman of the stave factory

(i) Rod., Best and Lita's company of Grand Rapids which had founded difficult last year, as been obaged to sun flowin plant pending a reorganization of the company. It is planned to re-

erganize to our mess on a strong r maneral basis

William L. Yule, aged fifty one, prominent manufacturer of Kenosha, diel recently at his winter home in Los Angeles. He was vice president of the Bain Wagon Works and interested in other manufacturing enter prises. Mr. Yule has been an invalid for the past two years. The remains were brought to Kenosha for burial. Mr. Yule is survived by a widow and one son, Gordon Yule, a senior at Yale.

C. A. Galloway, agod sixty-nine, leading manufacturer and lumber man of Fond du Lac, died suddenly on April 2. He was one of the proprietors of the Moore-Galloway Lumber Company, owner of Immer mills, wood manufacturing plants and dealer in lumber and millwork. Mr. Galloway is survived by his wife and two daughters.

Edward H. Walker, aged sixty, head of the Walker Lumber Company, president of the Dickinson Lumber Company and one of the most prominent citizens of Columbus, died in that city recently. The widow and three children, Gerald, Dorothy and Clarence, survive.

Matt Stephenson, half brother of Isaac Stephenson and brother of William Stephenson, superintendent of the Menominee River Broom Company, died at Marinette as the result of a paralytic stroke. He was sixty-nine years old.

Nelson D. Allen, seventy-four years old, for thirty-two years prominently identified with the lumbering industry of La Crosse, succumbed after a six months' illness. He was engaged in the early lumbering industry and retired about six years ago. Mr. Allen is survived by his widow. The couple had been making preparations to celebrate their golden weldding anniversary this year.

John W. Runkel, a retired lumberman of Oconto, died at the home of his daughter at Oshkosh, where he was spending the winter with his wife. He was seventy-eight years old. Mr. Runkel was engaged in the lumber business at Oconto for thirty two years. Besides the widow, four

sons and seven daughters survive.

Abner Conro, aged eighty-seven, a former lumberman of the Fox River valley, at Oshkosh and Rhinelander, died in the latter city after an extended illness. He is survived by three sons, James M., of Marshfield, Ore., Samuel A., of Allegheny, Ore., and Charles A., of Rhinelander.

The R. Connor Lumber Company lost its \$40,000 lawsuit against the Wisconsin Central Railway Company in Circuit court of Grand Rapids. The claim-rose out of a fire at Auburndale on May 18, 1906. The jury found that the Connor company suffered actual damages of \$35,503.84, but held that the railroad company was not negligent and that the fire was started as the result of an accident.

The Milwaukee road has taken off its two big trains between Iron Mountain and Menominee and is finishing the log hauling with regular trains. Although the log hauling season started very late, nearly all of the upper peninsula lumbermen found it an ideal season and it is estimated that about 100,000,000 feet of timber was cut. The fact that there was little snow made it possible to haul from the woods as much as is generally taken out in three months.

The federal government has purchased thirty-two hundred acres in Forest country from the Keith-Hiles Lumber Company for farm homes for the 400 Pottawatamie Indians. The land lies east and north of Stone Lake and near Wabeno. Homes are to be erected and an Indian

children's academy maintained.

With the disappearing of the ice in the pond of the mill of the Peshtigo Lumber Company, operations are being extended from day work to double shifts. Logs arriving on the railroad are being unloaded and a good supply for day and night sawing is being provided.

The labor situation in Milwaukee is regaining its normal standard slowly but surely. The annual slump was not only greater during the year of 1913-14, but it began from one to two months earlier than in former years, with the exception of 1908. This year it started as early as June. In former years plenty of work of all classes could be obtained as late as September. Since February 1 the rise in the situation has amounted to fully ten per cent toward normality. A steady increase in calls for more men is being noticed at the local branch of the Wisconsin Free Employment Bureau. Both skilled help and general laborers are finding employment with the advent of fair and milder weather. One incident to show the improvement is the fact that the Milwaukee road shops reengaged 200 men in the repair department who had been idle for several weeks following a general lay-off at the shops.

Pine Bluff, Arkansas

Manufacturers of

Genuine Forked-Leaf White Oak Red and Sap Gum Red Oak and Ash

¶ We offer to the trade a remarkably SUPERIOR lumber product.

¶ Our TIMBER is virgin forest growth of the highest type.

¶ Our MILLS are new and produce accurately manufactured stock.

¶ Our LUMBER is all KRAETZER-CURED—treated with steam under pressure directly from the saw—insuring quick drying to light weight, freedom from seasoning defects and stick-marking, splits and stain.

¶ Kraetzer-cured lumber will "stay where you put it."

I Dry kiln and oak flooring plant in connection.

 \P We solicit the inquiries and orders of critical and discriminating buyers.

¶ For straight cars of Yellow Pine, or mixed cars with Oak Flooring, write LONG-BELL LUMBER COMPANY, Kansas City, Mo.

TROUBLE?

Are you having any lumber trouble?

Does your oak warp, split, check or honeycomb in the kiln?

Does your gum stain, buckle, twist or do the bucking broncho act?

Do you have any difficulty with split panels and defective glue joints?

Do you have to dye, stain or refill your lumber to get a uniform color?

Do you have any reclaims on finished goods from bad glue joints, finish or other reasons?

You can cure all your lumber troubles by using

Kraetzer-cure

TRADE MARK

You don't have to buy Kraetzer-Cured Lumber—you can produce it yourself from air-dried, half-dry or green stock.

Your lumber will then dry in your kilns quick, straight and free of all defects.

We will tell you where to buy Kraetzer-Cured Lumber, if you ask us.

We will tell you about the Kraetzer Preparator, the use of which insures the quick and accurate seasoning of lumber, if you ask us.

We will send you a new and interesting pamphlet involving the entire theory and practice of steaming wood under pressure, if you ask us.

The Kraetzer Company 537 S. Dearborn St., CHICAGO

The Hardwood Market

=< CHICAGO >=

Continued quietness prevails in the local market, perticularly in the factory trade. As a general thing this quetness seem to be based on actual lack of orders on the part of furniture manufacturers and kindred lines not finding themselves in particular need of any quantities of limber Quite a little disappointment has been experienced by such manufacturers in lack of development of orders for their products, but for the most part they are expressing themselves as at least hopeful of future developments within the next few months. As it is, they are not operating on full time as a general proposition and are storing stocks on their floors. This has resulted, in a great many instances, in the postponing of deliveries of lumber shipments which have been on the books for several weeks.

The interior fluish plants are not doing any more than they had expected to do, but are continuing in fair shape. There promises to be an excellent opening up of building operations with the advent of warm weather, which is making itself felt in Chicago, which will react probably on the retail yards, through the interior finish plants, sash, door, and blind houses and other similar institutions.

The price situation continues on a fairly satisfactory basis with some little increase in the general level, but nothing that would indicate resumption of normal conditions, at least for a while to come. Generally speaking, oak seems to be in very fair request, that is, quartered oak, although plain oak is not in as good shape as had been desired or expected. Plain oak prices, however, have not broken any further to speak of and it is rather anticipated that in the course of a couple of months or so there will be a stiffening tendency.

There has been some slight improvement in the gum situation as a general proposition, but it cannot be said that red gum is even approaching a condition that is desired. Sap gum is in good shape for all lines of work and continues to show a marked strengthening.

Northern woods are doing fairly well and there is no apprehension felt on this score as to prices because of the general condition of stock at northern points, which is quite a little below what had been anticipated. As a result, there will probably not be more than enough stock to go around on the regular run of orders.

-----**<** NEW YORK **>**=

While the lumber business in the greater city and nearby territory cannot boast of a big improvement over the conditions last reported, it is not without some bright spots and the downhearted talk of two weeks ago is giving way to words of optimism in many quarters. The weather has at last settled and outdoor work will be reasonably sure of fair weather from now on. It is hoped that building operations will be resumed with something like normal activity and from the volume of inquiry noted there should be a good new work begun within the next month or six weeks. As usual in times like the present the buyers are not keen to take advantage of the low market and the bulk of the going business is for prompt shipment, indicating that supplies in the hands of manufacturers and yards are broken. This condition is not entirely unfavorable for the wholesale market will benefit when buying becomes more active and stocks are not so easy to obtain. It is reported that the mills have no large surplus on hand, and any large amount of buying will tend to advance the price. It seems to be the general opinion that the last half of the current year will show up better than the first, the reasons being the uncertainty in the business world generally, due to the legislative program and the rate advance case. That an early settlement of the rate case would do much to relieve the situation is generally conceded, but it is a large question and should be thoroughly investigated before reaching a decision in order that the final result will be fair to all and thus be permanent. Constant litigation of this kind can only work hardship to business which should be free to follow the natural course of enterprise and energy.

=≺ BUFFALO **>**=

The hardwood trade holds about steady, not much improvement having been noticeable during the past two weeks. Before the month is out wholesalers expect to see quite an improvement, but business so far has been a little less active than had been hoped for. The weather has been slow to warm up, so that the building demand has not started off actively and most buyers are taking stock only in small lots. Not much change has occurred in prices and there is room here for improvement.

Plain oak is said to be offering at lower prices in some mill sections, while elsewhere prices have been advanced. A good deal of this wood has been offering at such low prices that dealers have had little trouble in getting new stocks without paying advances. Chestnut is reported to be a little easier. Maple holds up well at the same firm prices as for some time. The trade in it compares favorably with that in other woods. Birch is holding its own, while gum is very quiet.

──≺ PHILADELPHIA ≻

Although the wholesale consurant indiministries oling territorially to their land to mostly technical flowing and the weather for term more or less unfavorable, there has been a fair volume of hardwood lumber moving The laying off of thousands of railroad employes during the last fortnight has added to a very palpable commercial depression, but notwithstanding, a strong feeling prevails that a decision favorable to the railroad companies concerning their demand for an increase of five per cent on freight rates will be given in the near future, an ultimatum, which it is believed will start up the wheels of business in the direction of a more material prosperity. It is the impression of carefully thinking merchants that the administration is recognizing the danger of the present legislative strangulation and will seek to curtail any further unnecessary miteriars with comporered of terrists. The narroweed market is in good control and prices are well maintained. Manufacturers are not forcing the market and the dealers who are desirous of securing themselves against the future realize that the stock pile at the mills is anything but overloaded

===-≺ BOSTON **>**=

The improvement of demand and movement noted in the last issue has been maintained, but there is no indication of any late increase in prices. The business revival this year has not been as marked as in many past years and there seem to be no dealers here who anticipate any appreciation in values. After the long, dull winter, there are some reports of business being done in certain items at very low prices, but In standard woods, such as quartered and plain oak, hickory, cherry, walnut and quartered sycamore, buying is done on about the usual basis, which is a certain indication that purchasers are not being quoted cut prices, excepting, of course, the usual abnormal cases that are often circulated far and wide. While poplar, gum and certain kinds of mahogany are not so strong as the woods mentioned above, the offerings in them are not so heavy as they have been in seasons past, and the fact that what reduced prices are made attract attention as "bargains" is significant that there is plenty of confidence in hardwood values as they are at present.

■ BALTIMORE >=

There are indications that an upturn in the hardwood trade is about to manifest itself, if it is not already under way. While reports about the state of business the early part of last month were almost uniformly unfavorable, some encouraging statements are made at the present time, more interest being shown by buyers in the offerings of the salesmen and the number of orders placed being of such proportions as to indicate increasing wants, and the receptivity of the buyers is not confined to one section, but is fairly general over the East. Portions of Pennsylvania are said to be taking up lumber almost with freedom, while Canada and other localities, among them New England, are also in the market to a decidedly greater extent than was the case not so long ago. It seems as if, with the advent of favorable weather, much business that was held up by snow and cold has gotten under way, with the result that the yards and other buyers find it necessary to augment their holdings or place orders for stocks which they happen to have run out of. It would be too much to say that a big spurt is on. So far the movement has not gone ahead of rather modest proportions, but a decided improvement is none the less to be reported, as compared with the extreme quiet that prevailed. The better feeling apparently extends to every part of the territory tributary to Baltimore, hardwood men of this city who have visited Ohio and other middle western states of late also reporting that they were able to book a number of good orders. As far as can be learned, the revival of interest in supplies affects practically the entire list of hardwoods, showing that more or less putting off of actual requirements was resorted to for a time. The potentialities of the hardwood trade seem to be very fair, there being much work ahead which calls for the use of hardwoods. The railroads, for instance, have not been buying at all of late, but this does not prove that they have no necessities to be met. Before long, they will reach a point where needs can no longer be put off, and then something like a rush will ensue. Whatever may be said of the financial condition of the railroads, they must keep in shape to take care of traffic, and the present deferment of purchases of lumber, along with all other materials, cannot be kept up indefinitely. Other enterprises are in much the same position, and it requires only a little clearing up of the general situation to give the hardwood business a decidedly vigorous impetus. The export trade remains quiet, with stocks abroad still large and with prices depressed. It behooves the shippers of hardwoods to go slow in the matter of forwarding lumber to foreign countries, and this fact is impressing itself upon the members of the trade with sufficient distinctness to exert a very definite effect upon the movement. The forwardings through this port are still very much restricted, and caution is generally exercised.

The hardwood trade in Columbus and all parts of central Ohio has been fairly active during the past fortnight. The movement has been as good as could be expected when the unsettled weather conditions are taken into consideration. Buying has been held back to a certain extent by the unsettled weather and dealers are loath to increase their stocks

Therefore the source of the first section of the source of

Prices are generally well maintained, although there is some shading of quetalities to the the market of the control to the control however. The indications are bright for active building operations not only in Columbus but also in the cities and towns in all parts of the Buckey state. It alies are the control to the control to the insh. Shipments are coming out steadily. Dry stocks in the lands of mill owners are not very large. Collections are somewhat slow.

Chestiant is probably one of the strongest rounts in the market and the demand is good for all grades. Sound wormy is the strongest grade. There is also a good demand for quartered and plain oak and prices are mehanged from the previous teach. Percaras to drag no well and stocks are not increasing. Basswood and ash are both firm and other hardwoods are unchanged.

With the weather in an unsettled condition and business disturbed to such in extent all over the section, there is not a great deal for lumbermen to be particularly happy about. Business is not gaining as it should and lumbermen are not trying to conceal the fact that business is not right. The only hopeful indication is the numerous inquiries which have never failed to be a foregumer of some business, but it does not show up and the only consolution seems to be the fact that inquiries continue. The low state of stocks in the hands of large consuming plants leads the most optimistic dealers to hand out hopeful stuff, they claiming that there will be more or less business increases in manufactured articles made of wood and that the plants doing any business at all will have to buy stock, as they have very little to run on. Up to this time purchasing has been very light and is confined to immediate requirements and is likely to remain that way for some time to come.

One lumberman stated that the settling of the regional bank locations and the establishment of them when the new currency law will be in full force will have a very good offet too business in every branch, and that the Interstate Commerce Commission will likely decide in favor of granting the railroads the 5 per cent increase in freight rates. It is claimed that this will result in a general purchasing by the railroads of lumber, iron and steel, as well as many other kinds of supplies, and with the railroads again in the market as big buyers all kinds of business will steadily improve.

If there is more demand for one wood over another it is for plain cark, but demand has slacked up for this ready seller, leaving ash the only wood in actual demand. The box makers are quite busy, however, and are consuming regularly good quantities of the low grades suitable for their purpose. The wagon and implement works are expecting to be in the market for limited supplies of hardwoods suitable for their needs and some dealers expect to do a little business in that field. The furniture trade does not improve much. Prices remain unchanged.

-----≺ INDIANAPOLIS ≻=

Spring weather has been bringing out a little more business during the last ten days. There has been no heavy buying thus far but there has been an increase in the number of inquiries which might indicate that improved conditions are on their way.

The hardwood business in this locality probably is not as good as it was this time last year, but the hardwood trade is no different in this respect than many other lines of industry. There seems to be at this time throughout Indiana a gradual revival of activity in hardwood using industries. Hardwood prices are practically unchanged from the quotations of the last few weeks.

------<-- MEMPHIS >---

There has been a slight improvement in the demand for hardwood lumber here recently, particularly from northern and eastern consuming and distributing interests following the more favorable weather in those sections. Furniture manufacturers have dispalved some interest recently but there is not the snap and vim and vigor to the market which were anticipated with so much confidence among hardwood interests here with the opening of the spring season. Many inquiries are being made but comparatively few of these are resulting in business. There is a great deal of booking of small orders but these are of a character to suggest that consuming and distributing interests are somewhat disposed to buy only for their more immediate needs. Holders, however, are still firm in their double conviction that business is going to be good and that prices will work higher, with the result that, during the present rather quiet period, there is no disposition on the part of anybody to cut There is a very good demand for plain red oak, and oak as a general proposition is moving at a fairly active rate. Ash is a good seller in all grades. Cottonwood and gum in the lower grades are in active demand and prices are well maintained. Box manufacturers are doing a large business and they are in the market for much raw material. The

Mahogany and Circassian Lumber & Veneers

¶ The largest assortment of finest figured Mahogany Logs, Lumber and Veneers in the country can be found at the Chicago plant of C. L. Willey.

¶ We are just in receipt of fifteen cars of remarkably superior Circassian Walnut Logs, large size, well-figured and of good color, which are now being cut into Veneers.

¶ A visit or correspondence from discriminating buyers of all varieties of fine Imported and Domestic Cabinet Woods in Lumber and Veneer is solicited.

¶ You will not only find the Willey warehouses well stocked with a superb collection of Circassian, Mahogany, Vermilion, Black Walnut and other fancy foreign and domestic lumber and veneers, but buyers are assured of prompt and painstaking service, and a quality of product not usually obtainable.

¶ To visit the plant take Blue Island Ave. car at the postoffice to Robey Street.

Possibly there is no good reason why YOU were not among these beneficiaries. If it is a matter of eligibility, and you feel that your plant does not at present comply with all requirements, confer with us anyway. Let us see if it cannot be brought up to an acceptable standard at no greater cost than will be justified by the prospective saving on insurance rates.

U. S. Epperson & Company

Attorney and Manager 1101 R. A. LONG BLDG. KANSAS CITY

upper grades of cottonwood, however, are comparatively slow. Sap gum in the upper grades moves well but red has shown little if any improvenent recently though there has been considerable increase in the number of inquiries. Cypress is still slow with the exception of shops, which move pretty well. Export business is still rather quiet.

=∹ NASHVILLE >=

Unsettled and severe wintry weather during the month of March had the effect of curtailing the demand for hardwood lumber in this market. April opened with more favorable weather, and it is believed that a material increase in business will be shown this month. There is a good demand for plain and quartered oak. Poplar in some grades is also in fair demand. Orders are also being received for ash, hickory and other lines in moderate way. Retail trade has been more active on account of more building operations.

=≺ LOUISVILLE >=

A considerable improvement in the demand for hardwoods has been in evidence since the first of the month, buyers having come to the end of their rope as far as reserve stocks are concerned, and having decided to place some of the orders which they have been holding up awaiting either a definite indication as to business conditions or a break in the market. While the general business situation has not been more closely defined than heretofore, lumber prices have not relaxed, either; and there being no further excuse for holding off, buyers are coming into the market. The opening of building operations is going to help conditions, while spring business with the furniture retailers and others will move enough goods to keep the furniture manufacturers working to fill in their stocks. However, general conditions in the furniture trade are probably below normal just now. The demand for quartered oak is excellent, and prices are firm. Plain oak is about the same, no special change being reported. Ash is showing improvement, as is cottonwood. Red gum is also said to be picking up. Some export business is making its appearance. Chestnut is in good call.

----≺ ST. LOUIS >--

Only a limited volume of business is being done by the local hardwood distributors but nevertheless trade is fairly good, all things considered, and it is growing better with good prospects in sight. While the local stocks are of good size and pretty well assorted, the distributors do not hesitate to buy when bargains are being offered by the manufacturers as it is well known that the country yards have depleted stocks and must replenish them when business begins. Plain-sawed white oak is most in demand with quartered red and white oak a close second. The better grades of red gum and thick ash are also in fairly good request. Prices on all items are being well maintained. The cypress trade is showing a gradual improvement. Many small orders are coming in and more will come with pleasant weather. The majority of the orders are for mixed car lots. The factory trade is not so good as it might be, although it, too, is showing an improvement and will be much better when general business conditions are improved.

=< MILWAUKEE **>**=

The hardwood business seems to be improving slowly. Plenty of inquiries are being made, a fact which leads wholesalers to believe that there are better things ahead. Actual orders from retailers about Wisconsin are coming in at a better rate, as stocks are light at most yards. The average dealer seems to have finally come to the conclusion that prices are sure to go higher and that the longer the placing of orders is deferred the greater chance there is of paying a higher figure.

Late developments seem to show that some of the large hardwood consuming concerns have enough stocks on hand to last them for a time, so it may be expected that these concerns will buy as little as possible until new stocks are in shipping condition. Most of the smaller concerns, however, are not stocked up so heavily, and wholesalers are looking for an improved demand from this source.

The decreased log cut of northern Wisconsin and Michigan during the past season is expected to result in higher prices for all lines of northern hardwood. No winter was experienced until the latter part of January, so that very little skidding or hauling was done until after February 1. Most concerns were fortunate in finally getting all their logs to the sidings, but the total cut was much smaller than had been anticipated.

Hardwood prices are holding firm, although few advances have been made as yet. Birch and basswood are in good demand and it is reported from the lumber country that birch logs are selling as high as \$25 per thousand on the cars, at least \$2 or \$3 higher than the selling price of a year ago. Maple is in good request, a natural result of a better inquiry for maple theoring. Southern oak, especially plain oak, is firm and is in leading demand among the southern bardwoods.

Building permits issued by W. D. Harper, Milwaukee building inspector, during the first three months of the present year, represent an investment of \$1,744,002, as compared with \$1,609,441 during the corresponding period a year ago. This represents a gain of \$134.561. Inspector Harper is confident that building operations will attain a new high point during 1914.

GIBSON TALLY BOOK

This three-throw tally ticket cover is made from aluminum, and accommodates four tally tickets—42x84 inches in size.

Folds compactly to less than one-fourth inch in thickness and fits side or inside coat pocket.

Gives large area of four tickets for complicated tallies, or straight grade can be made on one page.

Accommodates any form of tally ticket desired.

Accommodates any form of Lang trace desired.

Special, patented, triplicate tally tickets supplied, printed on waterproof paper with carbon backs. Tallies made on these tickets are unalterable. Their use enables the inspector to retain triplicate, and forward original and duplicate. Duplicate designed to be attached to invoice.

These tally books are perfection for durability-covenience, accuracy, and for systematizing the inspection and measurement of lumber

Patent applied for on covers. Copyrighted, 1910. Triplicate Tally Tickets patented.

PRICE LIST

Specimen forms of Tally Tickets mailed on application. Covers sold on approval to responsible concerns.

VENEERS AND PANELS

Ahnapee Veneer & Seating Co.

HOME OFFICE, FACTORY AND VENEER MILL, ALGOMA, WIS.

VENEER AND SAWMILL, BIRCHWOOD, WIS.

We manufacture at our Birchwood plant single ply veneers of all native northern woods and deliver stock that is in shape to glue.

From our Algoma factory, where we have specialized for twenty years, we produce panels of all sizes, flat or bent to shape, in all woods, notably in Mahogany and Quarter-Sawed Oak. We make no two-ply stock, and do not employ sliced our quartered oak. Our quartered oak panels are all from sawed veneer. Every yound of give we use is guaranteed hide stock. We do not use retainers. Our gluing forms are put under powerful screws and left until the glue has thoroughly set.

If you seek a guaranteed product that is the best, based on results accomplished by most painstaking attention and study of every detail, combined with the use of the best stock and an up-to-date equipment, our product will appeal to you.

If you are a "price buyer" we probably cannot interest you.

Veneers and Panels with a Reputation

WE manufacture Veneers in all the native woods and for all purposes. Also Built-up Panels in native and foreign woods—three and five-ply—and have established a reputation for furnishing high-grade material. Send us your inquiries and orders and become one of our satisfied customers.

Underwood Veneer Co.

Wausau. Wis.

Custom Mill Work, Storage, Inspection

ON

Foreign Fancy Woods, Mahogany, Cedar, Circassian

We receive the logs, store or warehouse them, manufacture them into lumber, cut or saw veneers, pile and store the product, and ship via any railroad. Also furnish inspection returns on logs or lumber. Can furnish accommodations and economies which it is impossible to secure elsewhere. We always have on our yards parcels of plain and figured African, Mexican and Cuban Mahogany, Circassian Walnut and Cedar logs, placed here for sale by direct foreign shippers, from which advantageous purchases can be made.

Little River Lumber Company TOWNSEND. TENN.

WE continue cutting Hardwoods and Hemlock out of big, smooth, clean, prime logs, and we give special attention to the making of stock that is hard to make and is required in heavy thicknesses and special widths and lengths. We are in shape now to cut Poplar, in any widths or thicknesses desired. Also are getting into the mill a fine lot of Chestnut logs that can be cut to order. A little later on will be glad to talk Southern Mountain Maple with you-IT IS SURE FINE. Also Hemlock in all widths and all grades.
